LOGARITHM OF EQUILIBRIUM CONSTANT, $\log_{10} K$

Source: Table Oy, American Petroleum Institute Research Project 44, at Natl. Bu. Stand., Washington, D. C.

1. K_f for formation from the elements; e.g., in the formation of water: $H_2+\frac{1}{2}O_2 \rightarrow H_2O$; $K_f=(H_2O)/(H_2)(\sqrt{O_2})$.
2. K_p for the combustion gas reactions where CO or CO_2 are formed:

(*a*) $C+H_2O \rightarrow CO+H_2$
(*b*) $CO_2+C \rightarrow 2CO$
(*c*) $CO+H_2O \rightarrow CO_2+H_2$
(*d*) $C+2H_2O \rightarrow CO_2+2H_2$
(*e*) $CO+\frac{1}{2}O_2 \rightarrow CO_2$

For example, in equation *a*, $K_f=(CO)(H_2)/(C)(H_2O)$; thus, at 900°K, $K_p=\log K_f(CO)+\log K_f(H_2)-\log K_f(C)-\log K_f(H_2O)$ $=11.1254+0-0-11.4978=-0.3724$

$\log_{10} K_f$ represents the logarithm (to the base 10) of the equilibrium constant for the reaction of forming the given compound in the gaseous state from the elements with all the reactants and products in the gaseous state and at the temperature indicated. $\log_{10} K_f=-\Delta Ff^\circ/2.302585\ RT=-\Delta Ff^\circ/0.004575651\ T$; ΔFf° in kcal/mole, T in °K.

The value of $\log_{10} K_f$ at all temperatures for the elements hydrogen, nitrogen, oxygen (all in gaseous state) and for carbon (as solid graphite) is zero. For all substances listed in the table the value of $\log_{10} K_f$ at 0°K is infinite. Interpolation to other temperatures in the interval 298.16° to 1500°K may be made by appropriate graphical or analytical methods. For temperatures below 298.16°K, values may be estimated by extrapolating to lower temperatures the values for 298.16°, 500°, and 700°K.

The values in this table are given to more significant figures than are warranted by the absolute accuracy of the individual values in order to retain the internal consistency of the several thermodynamic functions of a single substance, and also to retain the significance of the increments with temperature of a given thermodynamic function.

HEAT OF COMBUSTION OF VARIOUS SUBSTANCES

In the table below, gaseous products of combustion are to be assumed unless otherwise stated. See special tables for foods, coals, gases, and organic compounds. To convert gram-calories per gram to B.T.U. per pound, multiply the values below by 1800.

Substance	kg.-cal. per gram
Asphalt	9.532
Castor oil	8.850
Cod liver oil	9.40
Cottonseed oil	9.40
Dynamite (75%)	1.29
Graphite	α 7.840; β 7.856
Guncotton	1.0563
Hemoglobin	5.89
Hydrogen (to H_2O, liq.)	34.18
Hydrogen (to H_2O, steam)	29.15
Linseed oil	9.41
Mining powder	0.5088
Paraffin	10.34
Paraffin oil	9.80

Substance	kg.-cal. per gram
Petroleum	10.30 to 10.33
Pitch	8.4
Rape-seed oil	9.45
Sawdust, pressed	4.065
Spermaceti	9.95
Sulfur, monoclinic (to SO_2)	2.241
Sulfur, rhombic (to SO_2)	2.221
Whale oil	9.47
Wood, beech (13% H_2O)	4.168
Wood, birch (11.8% H_2O)	4.207
Wood, oak (13.3% H_2O)	3.990
Wood, pine (12.2% H_2O)	4.422

HEAT OF COMBUSTION OF ORGANIC COMPOUNDS

(Kharasch, *Bu. Stand. Jour. Research*, Vol. 2, p. 359 (1929))

The heat of combustion is expressed in kilogram calories per gram formula weight of the compound as given in the table; the values are based upon a combustion at atmospheric pressure and at 20°C, the final combustion products consisting of liquid water, gaseous carbon dioxide and gaseous nitrogen. To convert to British Thermal Units (B.T.U.) multiply the value in kg-cal. by 3.9685.

Name	Formula	Physical state	Heat of combustion in kg. cal.
Acetaldehyde	CH_3CHO	liq.	279.0

HEAT OF FORMATION OF ORGANIC COMPOUNDS

The heat of formation of an organic compound can be calculated since this value is equal to the sum of the heats of formation of the products of combustion less the heat of combustion (see table: Heat of Combustion of Organic Compounds) of the compound. A negative value indicates an evolution of heat during formation.

The heat of formation of the usual products of combustion of an organic compound are:

Free elements		0 kg-cal.
CO_2	(gas)	−94.05 kg-cal.
$\frac{1}{2}H_2O$	(liquid; from one atom of hydrogen)	−34.19 kg-cal.
SO_2	(gas)	−70.92 kg-cal.
H_2SO_4	(in dilute aqueous solution)	−211.84 kg-cal.
HBr	(in dilute aqueous solution)	−28.55 kg-cal.
HCl	(in dilute aqueous solution)	−39.53 kg-cal.
HF	(in dilute aqueous solution)	−75.56 kg-cal.
HNO_3	(in dilute aqueous solution)	−49.11 kg-cal.

EXAMPLES

Thus, to calculate the heat of formation of acetaldehyde and where the combustion is represented by the following equation:

$CH_3CHO + 2\frac{1}{2}O_2 = 2CO_2 + 2H_2O$

Heat of combustion of acetaldehyde. −279.0
Heat of formation of CO_2 ..... −94.05
Heat of formation of $\frac{1}{2}H_2O$ ..... −34.19

then, the heat of formation of acetaldehyde = $2(-94.05) + 4(-34.19) - (-279) = -45.86$ kg-cal. for 44 grams (the gram formula weight) of acetaldehyde.

To calculate the heat of formation of acetylene from its heat of combustion where the combustion is represented by the equation:

$C_2H_2 + 2\frac{1}{2}O_2 = 2CO_2 + H_2O$
Heat of combustion of acetylene.... −312.0
Heat of formation of CO_2 ..... −94.05
Heat of formation of $\frac{1}{2}H_2O$ ..... −34.19

then, the heat of formation of acetylene = $2(-94.05) + 2(-34.19) - (-312) = +55.52$ kg-cal. for 26 grams (the gram formula weight) of acetylene.

To calculate the heat of formation of methylamine from the heat of combustion of methylamine when the combustion is represented by the equation:

$CH_3NH_2 + 4\frac{1}{2}O = CO_2 + 2\frac{1}{2}H_2O + \frac{1}{2}N_2$
Heat of combustion of methylamine. −256.1
Heat of formation of CO_2 ..... −94.05
Heat of formation of $\frac{1}{2}H_2O$ ..... −34.19

then, the heat of formation of methylamine = $-94.05 + 5(-34.19) + 0(\text{nitrogen}) - (-256.1) = -8.90$ kg-cal. for 31 grams (the gram formula weight) of methylamine.

HEAT AND FREE ENERGY OF FORMATION OF COMPOUNDS AT 25°C

The standard heat of formation, $\Delta Hf°$, is the increment in the heat content (or enthalpy) associated with the reaction of forming the given compound from its elements, with each substance in its thermodynamic standard reference state of unit activity at the given temperature. When $\Delta Hf°$ is negative, heat is evolved in the process; when positive, heat is absorbed. In the following table the numerical value is expressed in kg-cal per mole.

The standard free energy of formation, $\Delta Ff°$ is the increment in free energy associated with the reaction of forming the given compound from its elements, with each substance in its thermodynamic standard reference state of unit activity. In the following table it is expressed in kg-cal per mole.

Log Kf is the logarithm (to the base 10) of the equilibrium constant of formation at 25°C, for the reaction of forming the given compound from its elements, with each substance in its thermodynamic standard reference state of unit activity at the given temperature.

The values given in the column headed $S°$ are for the entropy at 25°C and are expressed in calories per degree-mole.

The standard state for a pure solid or liquid at 25°C is normally taken as the pure substance in its thermodynamically stable modification at a pressure of one atmosphere. The standard state for a gas at any temperature is taken as the hypothetical reference state of unit fugacity (1 atmosphere) at the given temperature, in which state the heat content (enthalpy) is the same as that of the real gas at zero pressure at the same temperature. The standard state for a solute in aqueous solution is taken as the hypothetical ideal state of unit molality, in which state the partial molal heat content and heat capacity of the solute are the same as those in the infinitely dilute solution.

In the following table the physical state is indicated by: *c*, crystal (solid); *lq*, liquid; *g*, gas; *am*, amorphous; *gls.* glass; *ppt*, precipitated; *mon*, monoclinic; *oct*, octahedral; *rhb*, rhombic; *tet*, tetragonal.

HEAT AND FREE ENERGY OF FORMATION OF COMPOUNDS

To convert kg-cal to: international joules multiply by 4183.3; absolute joules multiply by 4184.0; British thermal units (btu) multiply by 3.9685.

The heat of solution in water of a given compound is given by the difference in the value for the heat of formation of the compound in the solid, liquid, or gaseous state and its heat of formation in aqueous solution. For example, for NaCl (*c*) ΔH is −98.23 kg-cal per mole, and for NaCl (*aq*, 400) is −97.21 kg-cal per mole. The numerical difference in these two values shows ΔH equal to 1.02 kg-cal per mole (the energy absorbed) for the reaction of dissolving one mole of sodium chloride in 400 moles of water. The free energy of solution may be calculated in the same manner.

For a more complete listing of compounds see the tables of *Selected Values of Chemical Thermodynamic Properties of the National Bureau of Standards* by Rossini *et al.*, Am. Petroleum Inst., Project 44, Carnegie Inst. of Tech. For an explanation of many useful ways in which the values can be utilized see the references quoted below. For a more complete listing of oxides, see Coughlin, Bulletin 542, Bureau of Mines, Washington, D. C. (1954).

Most of the values in the following table are from the above mentioned tables of *Selected Values of Chemical Thermodynamic Properties;* a few of the values are from the references which follow.

SURFACE TENSIONS OF VARIOUS LIQUIDS

The table below gives the surface tension of various liquids in dynes per centimeter. The nature of the gas in contact with the surface of the liquid is given in parenthesis following the name of the compound. The temperature in degrees centigrade is indicated by the superscript which accompanies the value in each case.

The value k_E (Eötvös constant) $= \frac{d\Gamma}{dt} = \frac{d(M/d)^{2/3}\gamma}{dt}$, where d is the density of the substance, M is the gram formula weight, t the temperature and γ is the surface tension in dynes per centimeter.

Name	Surface Tension in Dynes per Centimeter			k_E
Acetal (air)	23.25^{0}	21.65^{200}	13.5^{1000}	....
Acetaldehyde	22.4^{100}	21.2^{200}	17.0^{500}	1.8

FORMULAS RELATING SURFACE TENSION

In the following table, γ is the surface temperature in degrees absolute; T_c is the

Benzene: γ (vapor) $= 71.926 \left(1 - \frac{T}{561.6}\right)^{1.22} \pm 0.2$, from 0°C. to T_c

p-Bromotoluene: γ (air) $= 66.46 \left(1 - \frac{T}{694}\right)^{1.2}$

Carbon dioxide: $\gamma = 75 \left(1 - \frac{T}{T_c}\right)^{1.25}$

Carbon tetrachloride: γ (vapor) $= 67.671 \left(1 - \frac{T}{556.25}\right)^{1.22} \pm 0.2$, from 10°C. to 270°C.

Chlorine: $\gamma = 72 \left(1 - \frac{T}{T_c}\right)^{1.12}$

p-Chloroaniline: γ (air) $= 81.37 \left(1 - \frac{T}{787}\right)^{1.2}$

Chlorobenzene: γ (vapor) $= 72.20 \left(1 - \frac{T}{632.3}\right)^{1.22} \pm 0.2$, from 10°C. to 333°C.

p-Chlorobromobenzene: γ (air) $= 71.83 \left(1 - \frac{T}{722}\right)^{1.2}$

p-Chloroiodobenzene: γ (air) $= 74.71 \left(1 - \frac{T}{767}\right)^{1.2}$

p-Chloronitrobenzene: γ (air) $= 78.68 \left(1 - \frac{T}{768}\right)^{1.2}$

p-Chlorotoluene: γ (air or vapor) $= 66.65 \left(1 - \frac{T}{653}\right)^{1.2}$

ORGANIC SOLUTIONS AGAINST AIR

script and are expressed in moles per kilogram of water. The temperature in degrees Centigrade is given in parenthesis after the formula.

Surface Tension in Dynes per Centimeter

AND TEMPERATURE OF VARIOUS SUBSTANCES

tension in dynes per centimeter; T is the critical temperature in degrees absolute.

p-Dichlorobenzene: γ (air) $= 71.45\left(1-\frac{T}{675}\right)^{1.2}$

Ethyl alcohol: $\gamma = 230.564\left(1-\frac{T}{516.2}\right)^{1.45} - 304.339\left(1-\frac{T}{516.2}\right)^{2} + 139.756\left(1-\frac{T}{516.2}\right)^{3} \pm$ 0.3, from 10°C. to 240°C.

Ethyl ether: γ (vapor) $= 57.358\left(1-\frac{T}{466.9}\right)^{1.28} \pm$ 0.2, from 20°C. to 193°C.

p-Iodotoluene: γ (air) $= 69.28\left(1-\frac{T}{734}\right)^{1.2}$

Methyl alcohol: $\gamma = 173.245\left(1-\frac{T}{513.1}\right)^{1.38} - 243.042\left(1-\frac{T}{513.1}\right)^{2} + 146.344\left(1-\frac{T}{513.1}\right)^{3} \pm$ 0.2, from 70°C. to 235°C.

Methyl chloride: $\gamma = 72\left(1-\frac{T}{Tc}\right)^{1.22}$

Methyl formate: $\gamma = 77.83\left(1-\frac{T}{487.1}\right)^{1.23} \pm$ 0.2, from 50°C. to 214°C.

o-Nitrotoluene: γ (air) $= 74.06\left(1-\frac{T}{754}\right)^{1.2}$

Nitrous oxide: $\gamma = 86\left(1-\frac{T}{Tc}\right)^{1.33}$

SURFACE TENSION OF AQUEOUS

The table below gives values for the surface tension of various organic aqueous solutions of different concentrations. The concentration is indicated directly below

	Formula	Surface Tension in Dynes per Centimeter		
1	Acetic acid (30°C)	67.98 1.000%	60.11 5.001%	54.56 10.01%
2	Acetone (25°C)	55.45 5%	48.94 10%	41.11 20%

INTERFACIAL TENSIONS

The table below gives values for the interfacial tensions (γ_i) in dynes per centimeter, between various compounds and either water or mercury. The temperature in degrees Centigrade is indicated in each case by a superscript.

Name	γ_i, $\frac{\text{dynes}}{\text{cm}}$
iso-Amyl alcohol—H_2O	$5.0^{18°}$
iso-Amyl butyrate—H_2O	$23.0^{20°}$
iso-Amyl chloride—H_2O	$15.44^{20°}$
Aniline—H_2O	$5.77^{20°}$
Aniline—Hg	$341^{20°}$
Anisole—H_2O	$25.82^{20°}$
Benzaldehyde—H_2O	$15.51^{20°}$
Benzene—H_2O	$35.00^{20°}$
Benzene—Hg	$357.2^{20°}$
Benzyl alcohol—H_2O	$4.75^{22.5°}$
Bromobenzene—H_2O	$39.82^{20°}$
o-Bromotoluene—H_2O	$41.15^{20°}$
iso-Butyl alcohol—H_2O	$2.1^{18°}$
iso-Butyl alcohol—Hg	$342.7^{20°}$
iso-Butyl chloride—H_2O	$24.43^{20°}$
tert.-Butyl chloride—H_2O	$23.75^{20°}$
Butyronitrile—H_2O	$10.38^{20°}$
Carbon disulfide—H_2O	$48.36^{20°}$
Carbon disulfide—Hg	$336^{20°}$
Carbon tetrachloride—H_2O	$45^{20°}$
Chlorobenzene—H_2O	$37.41^{20°}$
Chloroform—H_2O	$32.8^{20°}$
α-Chloronaphthalene—H_2O	$40.74^{20°}$
p-Cymene—H_2O	$34.61^{20°}$
Diethyl carbonate—H_2O	$12.86^{20°}$
Dipropylamine—H_2O	$1.66^{20°}$
Ethyl alcohol—Hg	$364^{20°}$
Ethyl bromide—H_2O	$31.20^{20°}$
Ethyl ether—H_2O	$10.7^{20°}$
Ethyl ether—Hg	$379^{20°}$
Ethyl mercaptan—H_2O	$26.12^{20°}$
Ethyl oleate—H_2O	$21.34^{20°}$
Ethyl propyl ketone—H_2O	$13.58^{20°}$
Ethylbenzene—H_2O	$31.35^{17.5°}$

Name	γ_i, $\frac{\text{dynes}}{\text{cm}}$
Ethylene bromide—H_2O	$36.54^{20°}$
Ethylene bromide—Hg	$326^{20°}$
n-Hexane—H_2O	$51.1^{20°}$
n-Hexane—Hg	$378^{20°}$
Iodobenzene—H_2O	$41.84^{20°}$
Mercury—H_2O	$375^{20°}$
Mesitylene—H_2O	$38.7^{20°}$
Methyl iodide—Hg	$304^{20°}$
Methylene chloride—H_2O	$28.31^{20°}$
Methylene chloride—Hg	$342.5^{20°}$
Nitrobenzene—H_2O	$25.66^{20°}$
Nitrobenzene—Hg	$350.5^{20°}$
Nitroethane—Hg	$378^{20°}$
Nitromethane—H_2O	$9.66^{20°}$
o-Nitrotoluene—H_2O	$27.19^{20°}$
n-Octane—H_2O	$50.8^{20°}$
n-Octane—Hg	$374.7^{20°}$
n-Octyl alcohol—H_2O	$8.5^{20°}$
sec.-Octyl alcohol—Hg	$359.0^{20°}$
Oleic acid—H_2O	$15.6^{20°}$
Oleic acid—Hg	$322^{20°}$
iso-Pentane—H_2O	$49.64^{20°}$
Phenetole—H_2O	$29.4^{20°}$
n-Propyl alcohol—Hg	$368^{20°}$
Styrene—H_2O	$35.48^{19°}$
Toluene—H_2O	$36.1^{25°}$
Toluene—Hg	$359^{20°}$
iso-Valeric acid—H_2O	$2.73^{20°}$
o-Xylene—H_2O	$36.06^{20°}$
p-Xylene—H_2O	$37.77^{20°}$
o-Xylene—Hg	$359^{20°}$
m-Xylene—Hg	$357^{20°}$
p-Xylene—Hg	$361^{20°}$

VISCOSITY

The viscosity of a substance is the shearing resistance of a liquid film which separates two horizontal plates, one of which is being moved across the other. The absolute viscosity of a substance is the force in dynes which will move one square centimeter of a plane surface with a speed of one centimeter per second relative to another parallel plane surface from which it is separated by a layer of the substance one centimeter thick. This may be expressed by the following formula:

$$\text{viscosity} = \frac{\text{force} \times \text{film thickness}}{\text{area of plate} \times \text{velocity}}.$$

The unit of absolute viscosity is the poise which is equal to one dyne second per square centimeter. That is, when two plates have a shearing area of 1 square centimeter and a film thickness of 1 centimeter, if a force of one dyne is required to maintain a velocity of 1 centimeter per second, the fluid is said to have a viscosity of 1 poise. Since the poise (η) is such a large unit it is generally more convenient to use the millipoise (1/1000 poise) or, in the case of gases, the micropoise (1/1,000,000 poise). Frequently the viscosity of a liquid is expressed in terms of specific viscosity, which is its absolute viscosity compared with that of water at the same temperature. If the temperature in question is 20°C. the specific viscosity equals the viscosity in centipoises (1/100 poise) since the viscosity of water at 20°C. is approximately 1 centipoise.

The kinematic viscosity of a substance is the ratio of the absolute viscosity to the density of the substance at the temperature of measurement. The unit of kinematic viscosity is the stoke and is equal to that possessed by a fluid which has a viscosity of one poise and a density of one gram per cubic centimeter.

Of special importance in the field of lubrication are the so-called kinematic viscosimeters which measure the time in seconds for a given volume of liquid to flow through a definite orifice at some specified temperature. See special table for conversion of kinematic viscosity in centistokes to Saybolt, Redwood, and Engler viscosimeter values.

VISCOSITY OF VARIOUS LIQUIDS IN MILLIPOISES

In the table below is given the viscosity of various liquids in millipoises (0.001η) at the temperature in degrees Centigrade as indicated by the superscript.

Values in millipoises may be converted to centistokes by dividing by $10d^t$, where d^t is the density of the substance at the same temperature t.

Name	
Acetaldehyde	$2.751^{0°}$
	$2.521^{10°}$
	$2.307^{20°}$
Acetamide	$13.2^{105°}$

SPECIFIC VISCOSITY OF AQUEOUS SOLUTIONS AT 25° C

In the table below are given the specific viscosities of aqueous solutions of different concentrations. To convert these values to absolute viscosities multiply by the viscosity of water at 25°C. See special table for viscosity of water.

Name	1.0 Molar	0.5 Molar	0.25 Molar	0 125 Molar
Acetic acid	1.1131	1.0596	1.0304	1.0171

ABSOLUTE VISCOSITIES OF AQUEOUS GLYCEROL SOLUTIONS

M. L. Sheeley, *Ind. Eng. Chem. 24, 1060 (1932).**

Aqueous solutions of glycerol are suitable liquids for use as standards in calibrating technical viscosimeters. By means of an accurate specific gravity determination the percentage of glycerol concentration can be determined within ±0.02 per cent. (See special table of density of aqueous glycerol solutions.)

COEFFICIENTS OF COMPRESSIBILITY OF VARIOUS LIQUIDS AND AQUEOUS SOLUTIONS

In the table below are given values of β_t (the compressibility coefficient of a liquid at $t°_1$.) to be used with the formula

$$\beta_t = \frac{1}{V_1}\left(\frac{V_1 - V_2}{P_2 - P_1}\right)$$

where V_1 is the volume of a liquid under a pressure of P_1 in atmospheres at t°C., and V_2 is the volume at some other pressure P_2, at the same temperature.

Liquid	t °C.	Pressure Range, atm.	$\beta_t \times 10^6$

WATER

To find the cubical expansion of water, substitute in the following formulas:

0° to 33°: $V_t = V_0(1 - 0.0_464268t + 0.0_5850526t^2 - 0.0_7678977t^3 + 0.0_9401209t^4$

0° to 80°: $V_t = V_0(1 - 0.0_453255t + 0.0_5761532t^2 - 0.0_7437217t^3 + 0.0_9164322t^4$

CUBICAL EXPANSION OF SOLIDS

The coefficient of cubical expansion is the increase in volume per unit volume per degree C. rise in temperature. For ordinary work the assumption may be made that the coefficient of cubical expansion is about three times the coefficient of linear expansion.

BAROMETRY AND BAROMETRIC CORRECTIONS

In principle, the mercurial barometer balances a column of pure mercury against the weight of the atmosphere. The height of the column above the level of the mercury in the reservoir can be measured and serves as a direct index of atmospheric pressure. The space above the mercury in a barometer tube should be a Torricellian vacuum, perfect except for the practically negligible vapor pressure of mercury. The perfection of the vacuum is indicated by the sharpness of the click noted when the barometer tube is inclined. A barometer should be in a vertical position, suspended rather than fastened to a wall, and in a good light but not exposed to direct sunlight or too near a source of heat. The standard conditions for barometric measurements are 0°C., and gravity as at 45° latitude and sea level. There are numerous sources of error but corrections for most of these are readily applied. Some of the corrections are very small and their application may be questionable in view of the probably larger errors. The degree of consistency to be expected in careful measurements is about 0.005 inch with a 0.25 inch tube, increasing to 0.0015 inch with a tube 0.5 inch in diameter.

In reading a barometer of the Fortin type (the usual laboratory instrument for precision measurements) the procedure should be as follows: (*1*) Observe and record the temperature as indicated by the thermometer attached to the barometer. The temperature correction is very important and may be affected by heat from the observer's body. (*2*) Set the mercury in the reservoir at zero level, so that the point of the pin above the mercury just touches the surface, making a barely noticeable dimple therein. Tap the tube at the top and verify the zero setting. (*3*) Bring the vernier down until the view at the light background is cut off at the highest point of the meniscus. Record the reading.

The corrections to be made on the reading are as follow: (*1*) Temperature, to correct for the difference in thermal expansion of the mercury and the brass (or glass) to which the scale is attached.—This correction converts the reading into the value at 0°C. The brass scale table is applicable to the Fortin barometer. See tables. (*2a*) Latitude-gravity correction, and (*2b*) altitude-gravity correction, to compensate for differences in gravity, which would affect the height of the mercury column by variation in mass.—If local gravity is unknown, an approximate correction may be made from the tables. Local values of gravity are often subject to irregularities which lead to errors even when the corrections here provided are made. It is, therefore, advisable to determine the local value of gravity, from which the correction can be effected in the following manner:

$$B_t = B_r + \left(\frac{g_1 - g_0}{g_0}\right) \times B_r$$

in which B_t and B_r are the true and the observed heights of the barometer respectively, g_0 is standard gravity (980,665 cm sec^{-2}), and g_1 is the local gravity. It may be noted that for most localities, g_1 is smaller than g_0, which makes the correction negative. These corrections compensate the reading to gravity at 45° latitude and sea level. (*3*) Correction for capillary depression of the level of the meniscus.—This varies with the tube diameter and actual height of the meniscus in a particular case. Some barometers are calibrated to allow for an average value of the latter and approximating the correction. See table. (*4*) Correction for vapor pressure of mercury.—This correction is usually negligible, being only 0.001 mm at 20°C. and 0.006 mm at 40°C. This correction is added. See table of vapor pressure of mercury.

All tables are given in both metric and English units. When a barometer reading is to be converted from one set of units to another, it is important that all corrections be made in the original units before the conversion is made.

The corrections above do not apply to an aneroid barometer. These instruments should be calibrated at regular intervals by checking them against a corrected mercurial barometer.

For records on weather maps, meteorologists customarily correct barometer readings to sea level, and some barometers may be calibrated accordingly. Such instruments are not suitable for laboratory use where true pressure under standard conditions is required. Scale corrections should be specified in the maker's instructions with the instrument, and are also indicated by the lack of correspondence between a gauge mark usually placed exactly 30 inches from the zero point and the 30 inch scale graduation.

DETERMINATION OF HEIGHTS BY THE BAROMETRIC FORMULA OF BABINET

$$Z = C\frac{B_0 - B}{B_0 + B}$$

$$\text{C (in feet)} = 52494\left(1 + \frac{t_0°F + t°F - 64}{900}\right)$$

$$\text{C (in meters)} = 16000\left(1 + \frac{2(t_0°C + t°C)}{1000}\right)$$

Z = difference in height of two stations.

B_0, B = barometric readings at the lower and upper stations respectively.

t_0, t = temperature of the air at the lower and upper stations respectively.

BAROMETER TEMPERATURE CORRECTION—GLASS SCALE METRIC UNITS

The values in the table below are to be subtracted from the observed readings to correct for the difference in the expansion of the mercury and the glass scale at different temperatures.

TION—BRASS SCALE—ENGLISH UNITS

subtract the correction as indicated by its sign. On a metric scale barometer the zero correction is at 0°C. (32°F.); because of this difference, readings taken in inches which are to be converted to readings in centimeters should first be corrected for temperature.

Temp. °F.	Observed barometer height in inches

BAROMETRIC CORRECTION FOR GRAVITY

The values in the table below are to be subtracted from the readings taken on a mercurial barometer to correct for the decrease in gravity with increase in altitude.

Metric Units

VALUES OF GRAVITY AT VARIOUS STATIONS

The following table gives values for the latitude, longitude, altitude and gravity of various places. Gravity is assumed to be the resultant acceleration caused by the attraction of gravity and the rotation of the earth. The values marked * have been corrected for the effect of topography and of isostatic compensation. All values are based on the Potsdam system.

Station	Latitude ° ′	Longitude ° ′	Altitude, meters	Gravity, cm/sec²
AFRICA				
Abu Hamed, Egypt	19° 32.0′	33° 19.9′E.	339	978.538
Algiers	36 44.8	3 3 E.	213	979.905
Bizerta, Tunisia	37 16.4	9 52.5 E.	7	979.975
Cape Town	33 56.1 S.	18 28.7 E.	11	979.657

† The average distance a particle travels between collisions with other particles; not the distance between particles.

REDUCTION OF THE BAROMETER TO SEA LEVEL

A barometer located at an elevation above sea level will show a reading lower than a barometer at sea level by an amount approximately 2.5 millimeters (0.1 inch) for each 30.5 meters (100 feet) of elevation. A closer approximation can be made by reference to the following tables which take into account, (1) the effect of altitude of the station at which the barometer is read, (2) the mean temperature of the air column extending from the station down to sea level, (3) the latitude of the station at which the barometer is read and, (4) the reading of the barometer corrected for its temperature, a correction which is applied only to mercurial barometers since the aneroid barometers are compensated for temperature effects.

Example.—A barometer which has been corrected for its temperature read 650 mm. at a station whose altitude is 1350 meters above sea level and at a latitude of 30°. The mean temperature (outdoor temperature) at the station is 20°C.

Table A (metric units) gives for these conditions a temperature-altitude factor of..... 135.2
The Latitude Factor Table gives for 135.2 at 30° lat. a correction of..... +0.17
Therefore, the corrected value of the temperature-altitude factor is..... 135.37

Entering Table B (metric units), with a temperature-altitude factor of 135.37 and a barometric reading of 650 mm. (corrected for temperature), the correction is found to be..... 109.6
Accordingly the barometric reading reduced to sea level is 650 + 109.6 = 759.6 mm.

LATITUDE FACTOR—ENGLISH OR METRIC UNITS

For latitudes 0°-45° add the latitude factor, for 45°-90° subtract the latitude factor, from the values obtained in Table A.

Temp.—Alt. Factor From Table A	Latitude				
	0°	10°	20°	30°	45°
50	0.1	0.1	0.1	0.1	0.0
100	0.3	0.3	0.2	0.1	0.0
150	0.4	0.4	0.3	0.2	0.0
200	0.5	0.5	0.4	0.3	0.0
250	0.7	0.6	0.5	0.3	0.0
300	0.8	0.8	0.6	0.4	0.0
350	0.9	0.9	0.7	0.5	0.0
	90°	80°	70°	60°	45°

REDUCTION OF THE BAROMETER TO SEA LEVEL—METRIC UNITS

STANDARD LETTER SYMBOLS AND ABBREVIATIONS

At present the following publications in this field are available:

1. "American Standard Abbreviations for Scientific and Engineering Terms," ASA Z 10.1 (1941). To be revised in 1948 or 1949. The American Association of Physics Teachers also has a Committee on Nomenclature and Abbreviations under the chairmanship of Duane Roller, Harvard University.
2. "American Standard Letter Symbols for Hydraulics," ASA Z 10.2 (1942).
3. "American Standard Letter Symbols for Mechanics of Solid Bodies," ASA Z 10.3 (1942).
4. "American Standard Letter Symbols for Heat and Thermodynamics, Including Heat Flow," ASA Z 10.4 (1943); see also *Am. J. Physics* **11**, *344 (1943)*.
5. "American Standard Letter Symbols for Physics," ASA Z 10.6 (1948).
6. "American Standard Letter Symbols for Chemical Engineering," ASA Z 10.12 (1946).
7. "Illuminating Engineering Nomenclature and Photometric Standards," ASA Z 7.1 (1942).
8. "American Standard Letter Symbols for Gear Engineering," ASA B 6.5 (1943).
9. "Report of a Joint Committee of The Chemical Society, The Faraday Society and The Physical Society on Symbols for Thermodynamical and Physico-Chemical Quantities and Conventions Relating to Their Use."
10. "International Electrotechnical Letter Symbols," U. S. National Committee of the International Electrotechnical Commission, USNC 67 (1946).

Publication No. 9 above may be obtained from The Chemical Society, Burlington House, Piccadilly, London, W. 1, England; all the other publications are distributed by the American Standards Association, 70 East 45 Street, New York 17, N. Y.

The following list for physics embodies the final recommendations of the following Joint Committee on Letter Symbols for Physics of the American Standards Association and The American Association of Physics Teachers: Harold K. Hughes, *Chairman, Socony-Vacuum Laboratories, Brooklyn 22, New York;* E. L. Chaffee, *Harvard University;* A. W. Foster, *University of Western Ontario;* A. T. Jones, *Smith College;* Victor F. Lenzen, *University of California;* Duane Roller, *Harvard University;* M. W. Zemansky, *College of the City of New York*, as published in the *Am. J. Physics* **16**, *164 (1948)* and reprinted here by permission. In this list, symbols separated by commas are alternates of equal rank; reserve symbols, the use of which is discouraged, are given in parentheses.

(1) absorption coefficient for a room, mean (*acous.*) ..... a
(2) absorption index [$= (\lambda/4\pi x)\ln P_0/P$] ... κ
(3) acceleration, angular ..... α
(4) acceleration, gravitational ..... g
(5) local value ..... g_L
(6) standard value [$= 980.665$ cm/sec^2] g_0
(7) acceleration, linear ..... $\mathbf{a}$
(8) acceleration of free fall ..... $-g$
(9) accommodation coefficient ..... a
(10) action ..... S
(11) action variable ..... J
(12) activity at time t (*radioactivity*) I
(13) activity (*chem.*) ..... a
(14) activity, initial (*radioactivity*) ..... I_0
(15) adiabatic exponent [$pV^\gamma = $ const.] .... γ
(16) admittance (reciprocal impedance) ... Y
(17) admittance with plate load, grid or imput [$= g_g - jb_g$] ..... y_g
(18) admittance, output (plate) [$= g_p - jb_p$] ..... y_p
(19) affinity, electron [$= w/e$, volts] ..... ϕ
(20) affinity, gross electron [$= w_0/e$, volts] . ϕ_0
(21) altitude ..... h, y
(22) amplification factor [$= -(\partial e_p/\partial e_g)_{i_p}$] ..... μ
(23) amplification factor, gas (*photoelectric tube*) ..... μ
(24) amplification of amplifier, power .. A, A_p
(25) amplification of amplifier, voltage . A, A_v
(26) amplitude ..... A
(27) amplitude of simple harmonic pressure (*acous.*) ..... p
(28) angle of incidence, or angle between ray and normal in first medium . ϕ, i
(29) angle of refraction, or angle between ray and normal in second medium ..... ϕ', r
(30) angle, critical ..... ϕ_c
(31) angle, epoch ..... $\epsilon, (\phi)$
(32) angle, glancing ..... θ
(33) angle of contact ..... θ
(34) angle of deviation ..... δ
(35) angle of diffraction ..... θ
(36) angle of incidence, principal ..... ϕ
(37) angle of minimum deviation ..... D, δ_m
(38) angle of optical rotation ..... θ
(39) angle of reflection ..... r
(40) angle of slope in image space ..... u'
(41) in object space ..... u
(42) angle, plane ..... $\theta, (\alpha, \beta)$
(43) angle, polarizing, or principal angle of incidence in dielectrics ..... $\bar{\phi}$
(44) angle, refracting, of prism ..... A
(45) angle, solid ..... ω
(46) angular frequency of free vibration with damping ..... $\omega', (n')$
(47) angular frequency of impressed force ..... $\omega, (p)$
(48) angular frequency without damping ..... $\omega_0 (n)$

STANDARD LETTER SYMBOLS AND ABBREVIATIONS

(49) angular frequency, or periodicity, or angular velocity [$= 2\pi f$, radians/time] ..... ω
(50) aperature (*optics*) ..... a
(51) area ..... A, S, σ
(52) area of cross section, walls (*acous.*) ... S
(53) atomic number ..... Z
(54) atomic volume V
(55) atomic weight ..... A, M
(56) attenuation, optical ..... D
(57) attenuation constant ..... α
(58) azimuth angle (optics) ..... ψ
(59) azimuth angle, principal ..... Ψ
(60) base of natural logarithms [$= 2.718\ldots$] ..... ϵ, e
(61) Bohr (or orbital) magneton [$= eh/4\pi mc$] ..... μ_0
(62) Bohr radius [$= h^2/4\pi^2me^2$] ..... a_1
(63) Boltzmann constant ..... k
(64) Boltzmann function [$= \Sigma n_i \ln n_i$] ..... H
(65) Bragg planes in a crystal, spacing of ..... d
(66) Bragg reflection indices ..... h_1[$= nh$], h_2[$= nk$], h_3[$= nl$]
(67) breadth, or width ..... b
(68) brightness, or luminance [$= dF/dA \cos\theta$] ..... B
(69) candlepower, or luminous intensity [$dF/d\omega$] I
(70) capacitance, or permittance C
(71) capacitance, partial (with suitable subscripts) c
(72) capacitance, reciprocal, or elastance ... S
(73) capacitivity, or dielectric coefficient (dielectric constant
In cgs units ..... ϵ
In mks units (*see* permittivity) ..... ϵ_r
(74) Cauchy constants [$n = A + B/\lambda^2 + C/\lambda^4$] ..... A, B, C
(75) charge density, linear ..... λ
(76) charge density, surface ..... σ
(77) charge density, volume ..... ρ
(78) charge, electronic ..... $-e$
(79) charge, electric ..... q, Q
(80) chemical potential (*see* Gibbs function) ... μ
(81) circle of least confusion, radius of ..... Z
(82) coefficient of starting, or static (use f when μ designates the Poisson ratio) ..... μ_s
(83) collision frequency, molecular (no./time) ..... Z
(84) compliance C
(85) compressibility factor (coefficient of compressibility; reciprocal of volume modulus of elasticity) ... k
(86) concentration (*solutions*), or use bracket [ ] notation c
(87) concentration, molecular, or molecular density [$= N/V$] ..... n
(88) at 0°C and 1 atm (Loschmidt number) ..... n_0
(89) condensation (*acous.*) ..... s
(90) conductance, electric ..... G, g
(91) conductance, grid or input ..... g_g
conductance, grid, at zero frequency and constant plate potential [$= (\partial i_g/\partial v_g)_{v_p}$] ..... k_g
conductance, plate or output ..... g_p
(94) conductance, plate, at zero frequency and constant grid potential [$= (\partial i_p/\partial v_p)_{v_g}$] ..... k_p
(95) conductivity, electric ..... σ, (γ)
(96) conductivity, equivalent (mho/equivalent) ..... Λ
conductivity, molecular (mho/mole) .. μ
conductivity of an opening, acoustic ..... δ, (c)
(99) conductivity, thermal ..... k
(100) contrast of photographic emulsion .... γ
(101) control ratio, grid (*thyratrons*) ..... μ
(102) co-ordinate, generalized ..... q
(103) current, average ..... I_{av}, $\bar{I}$
(104) current, conduction I
(105) current, convection ..... I, ρv
(106) current density, electric ..... $\mathbf{J}$
(107) current displacement ..... $\mathbf{D}$, $\mathbf{D}/4\pi$
(108) current, effective (rms) I
(109) current, instantaneous ..... i, (I)
(110) current, maximum ..... I_m, (I_{max})
(111) current, maximum peak ..... I_m, I_{mp}
(112) current peak ..... I_p, I, (I_{pk})
(113) current, quiescent I
(114) current, saturation ..... I_s
(115) current, steady, direct I
(116) curvature ..... K
(117) decay constant [$N = N_0 \exp(-\lambda t)$ ... λ
(118) decay modulus [$s = A \cos(\omega t + \phi) \exp(-t/\tau)$] ..... τ
(119) deflection beam, galvanometer, etc.... δ
(120) degeneracy (statistical weight) ..... g
(121) degrees of freedom (*kinetic theory, Gibbs phase rule*) ..... f
(122) density [$= m/V$] ..... ρ, (D)
(123) density, linear (mass/length) .... λ, (ρ)
(124) density, molecular, or molecular concentration [$= N/V$] ..... n
(125) at 0°C and 1 atm (Loschmidt number) ..... n_0
(126) density of electric charge, volume ..... ρ
(127) density of electric flux [$= d\psi/dA$] .... $\mathbf{D}$
(128) density of magnetic flux ..... $\mathbf{B}$
(129) density, optical [$= \log_{10}P_0/P$] absorbance ..... D
(130) density, surface [$= m/A$] ..... σ, (ρ)
(131) density, vapor ..... ρ
(132) depth and height ..... h, y
(133) deviation ..... δ
(134) diameter ..... D
(135) diameter of molecule, collision ..... σ
(136) dielectric coefficient, or capacitivity (*see* permittivity) ..... ϵ
(137) dielectric flux density [$\Psi = \int \mathbf{D}\cdot d\mathbf{A}$]. $\mathbf{D}$
(138) dielectric flux, total [$= \int D\cdot dA$] ..... Ψ
(139) difference in phase (e.g. em) ..... δ
(140) diffusion, coefficient of (*fluid*) .... D, (μ)
(141) dioptric power [$= n/f$] ..... D
(142) Dirac h[$= h/2\pi$] ..... $\hbar$
(143) direction cosines ..... l, m, n
(144) disintegration constant [$N = N_0\epsilon^{-\lambda t}$] ..... λ
(145) dispersion [$= dn/d\lambda$] ..... σ
(146) dispersion, angular [$= d\theta/d\lambda$] ..... D
(147) dispersive power [$= (n_F - n_C)/(n_D - 1)$] ..... ω
(148) dispersive power, reciprocal of ..... ν
(149) displacement, angular ..... θ
(150) displacement components (of sound-bearing particle) ..... ξ, η, ζ
(151) displacement constant, Wien[$= \lambda_m T$] ..... b
(152) displacement, electric ..... $\mathbf{D}$
(153) displacement flux density ..... $\mathbf{D}$
(154) displacement flux, total electric [$= \int \mathbf{D}\cdot d\mathbf{A}$] ..... Ψ
(155) displacement in general ..... s
(156) displacement, linear ..... s
(157) displacement, longitudinal (*acous.*) ... ξ
(158) displacement of sound-bearing particle ..... ξ, η, ζ
(159) displacement, transverse (*acous.*) ..... η, (ξ, γ, w)
(160) displacement, volume (*acous.*) X
(161) dissociation, degree of (electrolytes) ... α
(162) distance, angular ..... θ

STANDARD LETTER SYMBOLS AND ABBREVIATIONS

(163) distance between adjacent principal foci of two lens units ..... Δ
(164) distance between a principal plane of a lens system and the appropriate principal plane of a unit p
(165) distance between image and principal focus of image space ..... x'
(166) distance between image and corresponding principal plane (image distance) ..... s'
(167) distance between lens units in an optical system ..... d
(168) distance from neutral axis to extreme fiber (*beams*) c
(169) distance between object and principal focus of object space x
(170) distance between object and corresponding principal plane (object distance) ..... s
(171) distance, image (*optics*) ..... s'
(172) distance, interplanar (*Bragg law*) ..... d
(173) distance, linear ..... s
(174) distance, object (*optics*) ..... s
(175) distance of approach, closest possible (in Rutherford scattering formula) b
(176) distance, radial ..... r
(177) distribution function ..... f, F
(178) double layer, strength of surface ..... P_s
(179) efficiency ..... η
(180) efficiency, voltage $[= V_{\text{theor}}/V_{\text{actual}}]$ (*electrolysis*) ..... η_V
(181) elastance, or reciprocal capacitance ... S
(182) elasticity, modulus of shear ..... G, n
(183) elasticity, volume modulus of (reciprocal of compressibility factor). B
(184) electric flux density $[\Psi = \int \mathbf{D}\cdot d\mathbf{A}]$ ... $\mathbf{D}$
(185) electric flux, total $[= \int \mathbf{D}\cdot d\mathbf{A}]$ ..... Ψ
(186) electromotive force, or emf ..... $\mathcal{E}, (E)$
(187) elongation, total (deflection) ..... δ
(188) emission, total electron (saturation) .. I_s
(189) emissivity ..... ϵ'
(190) monochromatic (color, spectral) ... ϵ_λ'
(191) total value ..... ϵ', ϵ_t'
(192) emittance ..... ϵ
(193) end correction for a tube (*acous.*) ..... α
energy
(194) density of radiant $[= dU/dV]$ .... u
internal or intrinsic (*thermodyn.*)
195) per atom or molecule ..... u, u_m
196) per mole ..... u, U, U_M
197) per unit mass ..... u
198) total value ..... U
199) kinetic ..... $E_k, (T)$
(200) average molecular $[= \frac{1}{2}m\bar{v}^2]$ ..... ϵ
(201) luminous $[= \int F dt]$ ..... Q
(202) nuclear dissociation ..... Λ
(203) of vibration ..... E_v
(204) potential ..... $E_p, U, (V)$
(205) radiant ..... U
(206) self $[= mc^2]$ ..... ϵ
(207) spectral radiant $[= dU/d\lambda]$ ..... U_λ
(208) storage factor ..... Q
(209) total ..... E, U
(210) work ..... $W, (w)$
enthalpy (heat content)
211) per atom or molecule ..... h, h_m
212) per mole ..... h, H, H_M
213) per unit mass ..... h
214) total value ..... H
entropy
(215) per atom or molecule ..... s, s_m
(216) per mole ..... s, S, S_M
(217) per unit mass ..... s
(218) total value ..... S
(219) equilibrium constant (products/reactants) ..... K
(220) equivalent weight, electrochemical M/Z
(221) equivalent, Joule ..... J
(222) expansion, total thermal ..... δ
(223) expansivity, linear, or coefficient of linear expansion ..... α
(224) expansivity, volume, or coefficient of volume expansion ..... β
(225) exposure $[= Et]$ ..... Σ
(226) extinction coefficient $[= (1/cl) \log_{10} P_0/P]$ ..... ϵ
(227) Faraday constant or equivalent ..... F
(228) field strength, electric ..... $\mathbf{E}$
(229) field strength, or field intensity, magnetic ..... $\mathbf{H}$
(230) figure of merit of inductance $[= X/R]$ Q
(231) filament (subscript designation) ..... f
(232) fine-structure or Sommerfeld constant $[= 2\pi e^2/ch]$ ..... α
(233) fluidity (reciprocal of viscosity) ..... ϕ
flux
(234) electric $[= \int \mathbf{D}\cdot d\mathbf{A}]$ ..... Ψ
(235) luminous ..... F
(236) magnetic $[= \int \mathbf{B}\cdot d\mathbf{A}]$ ..... Φ
(237) radiant, or radiant power $[= dU/dt]$ ..... Φ, P
(238) flux density, magnetic ..... $\mathbf{B}$
(239) flux density, propagation ..... Ξ
(240) flux density, radiant, or irradiance $[= d\Phi/dA$ or $dP/dA]$ ..... W
(When referring to a source is called radiancy, symbol $\mathfrak{R}$)
(241) focal length of image space ..... f'
(242) focal length of object space ..... f
243) force ..... F
244) force constant $[= -F/s]$ ..... k
245) force, gravitational ..... F, F_g
246) force in a string or membrane .... $F, (T)$
247) force, shearing (in beam section) V
(248) force, stretching ("tension"), in string or membrane ..... F
249) formality ..... F
250) free path ..... l, λ
251) free path, mean ..... l, λ
252) free path, Tait ..... l_T, λ_T
253) frequency (*elec. circuits, mech., acous.*). f
(254) frequency (*optics, quantum theory*) .... ν
(255) frequency, angular, of free vibration with damping ..... $\omega', (n')$
(256) frequency, angular, of impressed force ..... $\omega, (p)$
(257) frequency, angular, without damping ..... $\omega, (n)$
(258) frequency, angular, or periodicity, or angular velocity $[= 2\pi f$, radian/time] ..... ω
(259) frequency deviation $[= \Delta f/f_r]$ ..... δ
(260) frequency of molecular collision (no./time) ..... Z
(261) frequency, photoelectric threshold ..... $\nu_0, (f_0)$
(262) frequency, resonant, or natural ..... f_r
(263) frequency, rotational [rev/time] ..... n
(264) friction, coefficient of ..... μ
(265) rolling ..... μ_r
(266) sliding, or kinetic ..... $\mu, (\mu_k)$
(267) starting, or static ..... μ_s
(use f when μ designates the Poisson ratio)
(268) fugacity ..... f
(269) gain of amplifier, voltage ..... A, A_v
(270) gas constant, molecular, or Boltzmann constant ..... k
gas constant
(271) universal $[pV = nRT = mRT/M$; $pv_M = RT]$ ..... R
(272) specific $[pv = rT$, where $v = V/m$ and $r = R/M]$ ..... r
(273) Gibbs function equation, integration constant of I
Gibbs function

STANDARD LETTER SYMBOLS AND ABBREVIATIONS

(274) partial molal, or chemical, potential [$= \partial G/\partial n$] ..... μ
(275) per atom or molecule ..... g, g_m
(276) per mole [$= G/n$] ..... g, G, G_M
(277) per unit mass ..... g
(278) total value [$= H - TS$] ..... G
(279) grating space (distance between corresponding points) ..... d
(280) gravitational constant, Newtonian ... G
(281) grid control ratio (*thyratrons*) ..... μ
(282) grid or imput admittance with plate load [$= g_g - jb_g$] ..... y_g
(283) grid, control. Use subscript $_g$, or $_{g1}$, etc., numbered from cathode
(284) grid, injector. Use subscript $_{g4}$, etc., numbered from cathode
(285) grid-plate transadmittance [$= g_{gp} - jb_{gp}$] ..... y_{gp}
(286) grid-plate transadmittance, real part of, or grid-plate transconductance ..... g_{gp}, (g_m)
(287) gyromagnetic ratio ..... g
(288) half angle subtended at point object by objective of microscope ..... α
(289) half-life (*radioactivity*) ..... T
(290) Hamiltonian function or operator ... H
(291) Hamiltonian function or operator, perturbing ..... $\mathcal{H}$
(292) Hamilton-Jacobi equation variable, time dependent ..... W, (V)
(293) head (*hydrodyn.*) ..... h
heat capacity
(294) per atom or molecule ..... c, c_m
(295) per mole ..... c, C, C_M
(296) per unit mass (specific heat capacity) c
(297) total value C
(Use subscript $_p$ or $_v$ to indicate constancy of pressure or volume)
(298) heat content, relative L
(299) heat, electric or mechanical equivalent of (Joule equivalent) ..... J
(300) heat entering system ..... q
(301) heat flow path, length of ..... L, l
heat of reaction or phase change (evaporation, fusion, sublimation, etc.)
(302) per atom or molecule ..... Δh, Δh_m
(303) per mole ..... Δh, ΔH, ΔH_M
(304) per unit mass ..... Δh
(305) total value ..... ΔH
(306) heat, quantity of ..... Q
(307) heater, reference to (attach subscript to symbol) ..... h
(308) height, depth and thickness ..... h, y
(309) height of image ..... y'
(310) height of object ..... y
Helmholtz function, or maximum isothermal work function
311) per atom or molecule ..... a, a_m
312) per mole ..... a, A, A_M
313) per unit mass ..... a
314) total value [$= U - TS$] ..... A
315) Henry law constant ..... H
316) Hertzian vector ..... Π
317) humidity, absolute ..... ρ
318) humidity, relative ..... r, f
319) hydrolysis constant ..... K_h
320) hydrolysis, degree of (*electrolysis*) ..... h
321) ice point ..... T_0, t_0
322) illuminance, or amount of illumination [$= dF/dA$] ..... E
323) imaginary unit ($= \sqrt{-1}$, same as right-angle turning operator; use j in electric circuits) ..... j, i
324) impact parameter (*Rutherford scattering formula*) ..... p
325) impedance; acoustic impedance ..... Z
326) impedance, specific acoustic [$= ZA$] .. z
327) increment, finite ..... δ, Δ
328) inductance L
329) inductance, mutual ..... M, L_{12}, etc.
330) inductance, reciprocal ..... Γ
331) induction coefficient, or partial capacitance coefficient c
332) induction density, electric ..... D
333) induction density, magnetic ..... B
334) induction, electric flux of [$= \int \mathbf{D} \cdot d\mathbf{A}$] . Ψ
335) induction, magnetic flux of [$= \int \mathbf{B} \cdot d\mathbf{A}$] ..... Φ
336) inductivity, or absolute permeability .. μ
337) inertia of photographic plate i
338) integration constant of Gibbs function equation I
339) intensity, acoustic (e.g., erg cm^{-2}sec^{-1}). I
340) intensity, luminous [$= dF/d\omega$] I
341) intensity of magnetization, or magnetization [$= \mathbf{m}/V$] ..... $\mathbf{M}$
342) intensity, radiant [$= d\Phi/d\omega = dP/d\omega$] J
343) ionization, degree of (*solutions, electrolytes*) ..... α
344) irradiance, or radiant flux density [$= d\Phi/dA$ or dP/dA] ..... ε, H
345) Joule equivalent (electric or mechanical equivalent of heat) ..... J
346) Joule-Thomson (Kelvin) coefficient [$= (\partial T/\partial p)_H$] ..... μ
347) Kerr constant ..... K
348) $1/kT$ ..... β
349) Lagrange function, or Lagrangian [$= E_k - E_p$] L
350) Lande factor ..... g
351) leakage coefficient, magnetic ..... σ
352) length l
353) length of arc or path ..... s
354) length of image ..... y'
355) length of object (*optics*) ..... y
356) length of prism base ..... t
357) length of vibrating string, rod or tube. l
358) length, optical ..... Δ
359) length, rest ..... l_0
360) light, quantity of ..... Q
361) light speed in vacuum c
362) load per unit displacement ..... k
363) Lorentz unit [$= Be/4\pi mc^2$] L
364) Loschmidt number ..... n_0
(number of molecules per unit volume at 0°C and 1 atm)
(365) luminance, or brightness [$= dI/dA \cos\theta$] ..... B
(366) luminosity (luminous efficiency, monochromatic or visibility factor) [$= F_\lambda/P_\lambda = F_\lambda/\Phi_\lambda$] .... K_λ
(367) luminous efficiency [$= F/P$, $\lambda = 5550A$] ..... K
(368) luminous energy [$= \int F dt$] ..... Q
(369) magnetic field strength, or magnetic field intensity ..... $\mathbf{H}$
(370) magnetic flux [$= \int \mathbf{B} \cdot d\mathbf{A}$] ..... Φ
(371) magnetization [$= \mathbf{m}/V$] ..... $\mathbf{M}$
(372) magnetization, specific [$= M/\rho$] ..... σ
(373) magnetomotive force, or magnetic scalar potential ..... $\mathfrak{F}$
(374) magneton, nuclear [$= \mu_0/1838$] ..... μ_I
(375) magnification, linear ..... m
(376) magnification, angular [$= \tan u'/\tan u$] γ
(377) mass (general use) ..... m
(378) mass of atom or molecule ..... m, m_p
(379) mass of electron (use m_e when m is magnetic quantum number) ..... m
(380) mass per unit area ..... σ, (ρ)
(381) mass per unit length ..... λ, (ρ)
(382) mass per unit volume (density) ... ρ, (D)

STANDARD LETTER SYMBOLS AND ABBREVIATIONS

(383) mass, reduced $\frac{1}{\mu} = \frac{1}{m_1} + \frac{1}{m_2}$ ..... μ
(384) mass, rest ..... m_0
(385) mean-life (*radioactivity*) ..... τ
(386) Miller indices ..... h, k, l
(387) mixing ratio, or water-vapor content .. w
(388) modulation factor ..... m
(389) modulus of decay [$s = A \cos(\omega t + \phi) \exp(-t/\tau)$] ..... τ
(390) modulus of elasticity, shear ..... G, n
(391) modulus of elasticity, volume (reciprocal of compressibility factor) B
(392) modulus of elasticity, Young .... E, Y
(393) modulus of section [$= I/c$, where c is distance of neutral axis from extreme fiber] ..... Z
(394) molecular cross section, effective ... σ, S
(395) molecular mass ..... m, m_m
(396) molecules, number of ..... N
(397) mole factor, or van't Hoff coefficient ... i
(398) moment, electric ..... p
(399) moment, quadrupole (electric) ..... Q
(400) moment, magnetic ..... m
(401) moment of area [$= \int y dA$] ..... Q
(402) moment of atom, molecule or dipole, electric ..... μ, μ_e
(403) magnetic ..... μ_m, μ
(404) moment of inertia ..... I, I_{xx}, etc., (J)
(405) moment of inertia, areal I
(406) polar [$= \int r^2 dA$] ..... J
rectangular [$= \int y^2 dA$]
(407) momentum, generalized ..... p
(408) Napierian base ..... ϵ, e
(409) normality C
(410) normalization factor (*probability*) .... N
(411) number ..... n
(412) number of atoms or nuclei (if more than one type is considered) $N_1, _2 \ldots$
(413) number of atoms or nuclei at time t (*radioactivity*) ..... N
(414) number of atoms or nuclei, initial (*radioactivity*) ..... N_0
(415) number of atoms or nuclei, initial (if more than one type is considered) ..... $N^\circ_1, _2 \ldots$
(416) number of components (Gibbs phase rule) ..... n
(417) number of lines of a grating, total .. N
(418) number of molecular collisions per unit time, or collision frequency .. Z
(419) number of molecules (total) ..... N
(420) number of molecules per mole at 0°C and 1 atm (Avogadro number) ..... N_0
(421) number of molecules per unit volume (molecular concentration) ..... n
(422) at 0°C and 1 atm (Loschmidt number) ..... n_0
(423) number of moles ..... n
(424) number of phases (*elec. circuits*) .... m
(425) number of revolutions or rotations per unit time ..... n
(426) number of turns or of conductors ..... N
(427) orbital (or Bohr) magneton ..... μ_0
(428) order of spectrum ..... $m, (n)$
(429) oscillation period ..... T
(430) path difference, optical ..... Δ
(431) Peltier coefficient ..... Π
(432) Peltier potential ..... V_π
(433) periodicity [$= 2\pi f$] ..... ω
(434) periodicity, resonant ..... ω_r
(435) period of a periodic motion ..... T
(436) permeability or inductivity, magnetic. μ
(437) permeability, reciprocal, or reluctivity [$= 1/\mu$] ..... ν
(438) of free space ..... ν_0
(439) permeability, relative magnetic [$= \mu/\mu_0$ mks units] ..... μ_r
(440) permeance [$= L/N^2$] ..... Γ
(441) permittance, or capacitance C
(442) permittivity (mks units; *see* capacitivity) ..... ϵ
(443) of free space ..... ϵ_0
(444) relative [$= \epsilon/\epsilon_0$] ..... ϵ_r
(445) phase angle ..... ϕ
(446) phase constant [$\gamma = \alpha + j\beta$] ..... β
(447) piezoelectric strain constant or modulus δ
(448) piezoelectric stress constant ..... ϵ
(449) Planck constant ..... h
(450) Planck function [$= -A/T$] ..... Ψ
(451) Planck radiation law constants
$$\left[\frac{J_\lambda}{A \cos\theta} = N_\lambda = c_1/\lambda^5 \left(\exp\frac{c_2}{\lambda T} - 1\right)\right]$$
..... c_1, c_2
(452) plate power ..... P_p
(453) plate resistance ..... r_p
(454) Poisson ratio ..... μ, ν
(455) polar coordinates ..... r, θ
(456) polarization, electric ..... P
(457) polarization, surface, or strength of double layer (*elec.*) ..... P_s
(458) polarization, magnetic, or magnetization ..... M
(459) position vector ..... r
potential, chemical (see Gibbs function)
(460) potential coefficient, partial ..... p
(461) potential difference, average .... $V_{av}, \bar{V}$
(462) potential difference, contact or Volta. V_v
(463) potential difference, electric V
(464) potential difference, excitation ..... V_e
(465) potential difference, instantaneous .. v
(466) potential difference, maximum ..... $V_m, (V_{max})$
(467) potential difference, maximum peak ..... $\hat{V}_m, V_{mp}$
(468) potential difference, peak .. $\hat{V}$, V_p, (V_{pk})
(469) potential difference, Peltier ..... V_π
(470) potential difference, quiescent ... $\bar{V}$
(471) potential difference, rms or effective . V
(472) potential difference, Seebeck ..... V_s
(473) potential difference, Thomson ..... V_τ
(474) potential difference, steady d-c ... V
(475) potential, electric V
(476) potential, electromagnetic scalar ... ϕ
(477) potential energy ..... $E_p, U, (V)$
(478) potential, inner (*metals*) ..... V, V_i
(479) potential, ionization ..... V_i
(480) potential, kinetic, or Lagrange function [$= E_k - E_p$] L
(481) potential, magnetic scalar (magnetomotive force) ..... $\mathfrak{F}$
(482) potential, magnetic vector ..... A
(483) potential, velocity (*hydrodyn.*) ..... ϕ
(484) power ..... P
(Use same system of subscripts as for current except that P, unmodified, signifies average power)
(485) power, active (*elec.*) ..... P
(486) power, emissive, monochromatic .. J_λ, J_ν
(487) power, emissive, total ..... J
(488) power, input ..... P_i
(489) power of lens system, or refracting power [$= n/f$, diopters] ..... D
power, output ..... P_o
power, plate ..... P_p
power, radiant, or radiant flux ..... P, Φ
power, thermoelectric ..... Q
Poynting vector ..... Π
pressure [$= F/A$] (Use P for total pressure when p represents vapor pressure) ..... p
(496) amplitude of simple harmonic ..... $\hat{p}$

STANDARD LETTER SYMBOLS AND ABBREVIATIONS

(497) static ..... P_0
(498) varying ..... p
(499) pressure, critical ..... p_c
(500) pressure, osmotic ..... p, II, (π)
(501) pressure, partial ..... p
(502) pressure, vapor ..... p
(503) probability ..... P
(504) product of inertia ..... I_{xy}, etc.
(505) propagation constant [$= \alpha + j\beta$] ..... γ
(506) pulsatance, or periodicity [$= 2\pi f$] ...
(507) Q-factor, or quality factor of reactor [$= X/R$] ..... κ
(508) quantity of light, or luminous energy [$= \int F dt$] ..... Q
quantum number
(509) azimuthal or orbital l
(510) azimuthal or orbital, total L
(511) hyperfine [$= I + J$] ..... F
(512) ..... j
(513) inner, total ..... J
(514) magnetic ..... m
(515) magnetic, total ..... M
(516) principal ..... n
(517) rotational ..... R
(518) spin ..... s
(519) spin, total ..... S
(520) spin, nuclear I
(521) vibrational v
(Strictly, spin is not a quantum number)
(522) radiancy, or radiance, or radiant flux density [$d\Phi/dA = dP/dA$] . $\mathcal{R}$, W
(523) radiant energy ..... U
(524) radiant energy density [$= dU/dV$] . u
(525) radiant energy, spectral (monochromatic) [$= dU/d\lambda$] ..... U_λ
(526) radiant flux density [$= d\Phi/dA$ or dP/dA] ..... W
(When referring to a source is called radiancy, symbol $\mathcal{R}$)
(527) radiant intensity, spectral [$= dJ/d\lambda$] J_λ
(528) radiant power, or radiant flux [$= dU/dt$] ..... Φ, P
(529) radiation law constants (*see* Planck radiation law constants) .. c_1, c_2
(530) Stefan-Boltzmann ..... σ
(531) Wien ..... b
(532) radius ..... r
(533) radius of circle of least confusion ..... Z
(534) radius of curvature ..... ρ
(535) radius of gyration ..... k
(536) radius of image of a point ..... Z
(537) radius of lens zone ..... h
(538) radius of nucleus ..... r
(539) radius of tube, disk or membrane (*acous.*) ..... a, (R)
(540) radius vector ..... $\mathbf{r}$
(541) range (*radioactivity*) ..... R
(542) ratio of speed to speed of light [$= v/c$]. β
(543) reactance, acoustic reactance X
(544) capacitive ..... X_C
(545) inductive ..... X_L
(546) reactance, specific acoustic [XA] x
(547) reaction rate, specific, or reaction velocity constant ..... k
(548) reaction velocity [$= -dc/dt$] ..... u
(549) reciprocal impedance, or admittance . Y
(550) reciprocal permeability, or reluctivity ν
(551) recombination, coefficient of ..... α
(552) rectangular coordinates ..... x, y, z
(553) reflectance, or reflection factor [$= P/P_0$] ..... ρ, ρ'
(554) reflectivity ..... ρ, ρ'
(555) refractive index ..... n, (μ)
(556) refractive index, group ..... n_g, (μ_g)
(557) relative dielectric coefficient, or specific inductive capacity ..... ϵ, ϵ_r
(558) relative magnetic permeability .... μ, μ_r
(559) relativity ratio [$= v/c$] ..... β
(560) reluctance ..... $\mathcal{R}$
(561) reluctivity [$= 1/\mu$] ..... ν
(562) resilience, coefficient of, or coefficient of restitution ..... e
(563) resistance, acoustic ..... R
(564) resistance, electric ..... R, (r)
(565) resistance, plate ..... r_p
(566) resistance, radiation ..... R
(567) resistance, specific, or resistivity ..... ρ
(568) resistance, specific acoustic [$= RA$] .. r
(569) resistance, thermal ..... R
(570) resistance, thermal coefficient of ..... α
(571) resistivity, or specific resistance ..... ρ
(572) resistivity, thermal ..... $1/k$
(573) resolving power of telescope, angular .. σ
(574) resonance periodicity ..... ω
(575) restitution, coefficient of, or resilience. e
(576) restoring force per unit displacement .. k
(577) revolutions or rotations per unit time. n
(578) Richardson equation factors [$I_s = AT^2e^{-b/T}$] ..... A, b
(579) right-angle turning operator ($= \sqrt{-1}$; use j in elec. circuits) ..... j, i
(580) rigidity, or shear modulus of elasticity. n
(581) rms (effective) potential difference ... V
(582) rotation, specific [$= \theta/lc$] ..... α
(583) rotation, specific magnetic, or Verdet constant ..... V, ω
(584) Rydberg constant ..... R
(585) Rydberg constant for infinite mass .. R_∞
(586) safety factor ..... N
(587) sag or deflection of beam ..... δ
(588) scattering coefficient (turbidity) ..... s
sensitivity of phototube
(589) static ..... S
(590) dynamic ..... s
(591) shear modulus of elasticity ..... G, n
(592) shell, strength of magnetic I
(593) slip (*elec. machinery*) ..... σ, s
(594) Sommerfeld, or fine-structure, constant [$= 2\pi e^2/ch$] ..... α
(595) spacing of Bragg planes in a crystal .. d
(596) specific heats, ratio of [$= c_p/c_v$] ..... γ
(597) speed ..... u, v
(598) speed at time t ..... u, u_t, v, v_t
(599) speed, angular ..... ω
(600) speed, average ..... $\bar{u}$, $\bar{v}$, u_{av}, v_{av}
(601) speed, initial ..... u_0, v_0
(602) speed, linear or particle ..... u, v
(603) speed, most probable ..... $\hat{u}$, $\hat{v}$, (c_0), α
(604) speed of light in vacuum; speed of sound c
(605) speed, rms ..... $\bar{u}$, $\bar{v}$, (C)
(606) spin ..... s
(607) nuclear I
(608) total ..... S
(609) spring constant [$= -F/s$] ..... k
(610) square-root of minus one [$= \sqrt{-1}$]. j, i
(This is the special case, where $\phi = \pi/2$, of the operator $\exp j\phi$ which turns a vector through the angle ϕ; use j in elec.)
(611) Stefan-Boltzmann constant [$= \mathcal{R}/T_4$]. σ
(612) steradiancy [$= dJ/dA \cos\theta$] ..... $\mathcal{B}$, N
(613) strength of magnetic pole ..... p, (m)
(614) strength of magnetic shell I
(615) strength of simple acoustic source .... A
(616) summation operator ..... Σ
(617) super-compressibility factor ..... y
(618) surface tension ..... γ, σ
(619) susceptance ..... B, b
(620) susceptibility, electric [$\mathbf{P} = \eta\mathbf{E}$] ..... η
(621) susceptibility, volume magnetic [$\mathbf{M} = k\mathbf{H}$] ..... k
(622) susceptibility, specific magnetic [$= k/\rho$] ..... χ

STANDARD LETTER SYMBOLS AND ABBREVIATIONS

(623) Tait free path ..... l_T, λ_T
(624) temperature, absolute ..... T, (Θ)
(625) temperature coefficient of resistance ... α
(626) temperature, critical ..... t_c, T_c
(627) temperature, Debye characteristic ... Θ
(628) temperature, Kelvin ..... T, (Θ)
temperature of ice point
(629) absolute ..... T_0
(630) ordinary ..... t_0
(631) temperature, ordinary ..... t, (θ)
(632) tension (force) in spring or membrane. F
thermal expansion, coefficient of, or expansivity
(633) linear ..... α
(634) volume $[= \alpha_1 + \alpha_2 + \alpha_3]$ ..... β
(635) thickness and height ..... h, γ
(636) Thomson coefficient ..... σ
(637) time (Use τ when t is used for temperature) ..... t, (τ)
(638) time constant ..... τ
(639) time-dependent variable in Hamilton-Jacobi equation ..... W, (V)
(640) time, reverberation ..... T
(641) torque per unit twist, or torsion constant ..... k
(642) transconductance, grid-plate (real part of grid-plate transadmittance) ..... g_{pg}, (g_m)
(643) transconductance at zero frequency and constant plate potential $[= (\partial i_p/\partial v_g)_{vp}]$ ..... s_p
(644) transmittance $[= P/P_0]$ ..... τ
(645) turning operator, 90° $(= \sqrt{-1}$; use j in elec. circuits) ..... j, i
(646) u/c ..... β
(647) valence ..... z
(648) Van de Waals constants $\left[\left(p + \frac{n^2a}{V^2}\right)(V - nb) = nRT\right]$ a, b
(649) Van't Hoff coefficient i
(650) vapor pressure constant i
(651) variable ..... x, y, z
(652) variable in Hamilton-Jacobi equation, time-dependent ..... W, (V)
(653) vector in X-direction, unit i
(654) in Y-direction ..... j
(655) in Z-direction ..... k
(656) tangent to path, unit ..... τ
(657) vector, position ..... r
(658) vector turning operator $[= \sqrt{-1}]$ .. j, i
(This is the special case, where $\phi = \pi/2$, of the operator $\exp j\phi$ which turns a vector through the angle ϕ; use j in elec. circuits)
(659) velocity ..... u, v
(660) velocity, angular ..... ω
(661) velocity, average ..... $\bar{u}$, $\bar{v}$, u_{av}, v_{av}
(662) velocity at time t ..... u, v, u_t, v_t
(663) velocity, components of linear or particle ..... u_x, u_y, u_z (u, v, w)
(664) velocity constant, reaction ..... k
(665) velocity, group ..... u_g, v_g, u_g, v_g
(666) velocity, initial ..... u_0, v_0
(667) velocity, ionic (with suitable subscript) ..... u
(668) velocity, linear or particle ..... u, v
(669) velocity, most probable ..... u_p, v_p, (c_0, α)
(670) velocity of light in vacuum c
(671) velocity of sound or other waves ... c, v
(672) velocity, phase or wave ..... u_w, u_ϕ, (w)
(673) velocity potential ..... ϕ
(674) velocity, reaction $[= -dc/dt]$ ..... u
(675) velocity, rectangular components ..... u_x, u_y, u_z, v_x, v_y, v_z
(676) velocity, rms ..... $\bar{u}$, $\bar{v}$, (C)
(677) velocity, specific reaction, or reaction velocity constant ..... k
(678) Verdet constant ..... V, ω
(679) viscosity, coefficient of kinematic $[= \eta/\rho]$ ..... ν
(680) viscosity, coefficient of ..... η
(681) visibility factor, or luminosity, or monochromatic luminous efficiency $F_\lambda/P_\lambda = F/\Phi_\lambda$ ..... K_λ
(682) voltage (*see* potential difference) ... V
(683) Volta potential, or contact potential. V_V
volume
(684) critical ..... V_c
(685) molecular V
(686) of a cavity or room V
(687) of configuration-space V
(688) of phase space ..... Ω
(689) per atom or molecule ..... v, v_m
(690) per mole ..... v, V, V_M
(691) per unit mass (specific volume) ... v
(692) specific $[= V/m]$ v
(693) total ..... V, (τ)
(694) volume electric charge density ..... ρ
(695) volume expansivity, or coefficient of volume expansion ..... β
(696) volume modulus of elasticity (reciprocal of compressibility factor) B
(697) volume susceptibility, magnetic $[\mathbf{M} = k\mathbf{H}]$ ..... k
(698) water-vapor content, or mixing ratio .. w
(699) wave-function, time dependent ..... ψ
(700) wave-function, time independent ..... u
(701) wavelength ..... λ
(702) wavelength constant $[= 2\pi/\lambda]$ ... k
(703) wavelength, effective ..... λ_e
(704) wave number ..... σ
(705) weight $[= mg]$ ..... w, F, (W)
(706) weight, equivalent (*chem.*) ..... M/z
(707) weight, molecular ..... M
(708) weight, specific $[w/V]$ ..... γ
(709) weight, statistical, or degeneracy .... g
(710) weightivity, or specific weight $[w/V]$ .. γ
(711) width or breadth ..... b
(712) width of slit (transparent portion) .... a
(713) Wien displacement constant $[= \lambda_m T]$ .. b
(714) work ..... W, (w)
(715) work function, gross ..... w_g
(716) work function per unit charge, gross, or gross electron affinity $[d\phi_g = dw_g/de$, volts] ..... ϕ_g
(717) work function, net ..... w
(718) work function per unit charge, net, or electron affinity $[d\phi = dw/de$ volts] ..... ϕ
(719) Young modulus of elasticity ..... E, Y

SUBSCRIPTS

adiabatic: attach subscript $_s$ to symbol
adsorbed: attach subscript $_a$ to symbol
average value: use subscript $_{av}$, or bar over symbol (e.g., I_{av}, $\bar{I}$)
black body, reference to: attach subscript $_b$ to symbol
cathode: attach subscript $_c$ to symbol
control grid: subscript $_g$
(For several grids, use subscript $_{g1}$, $_{g2}$, . . . , beginning at cathode)
critical properties: subscript $_c$
gas or vapor, reference to: attach subscript $_G$ to symbol
grid, screen: use subscript $_s$ or $_{g2}$, etc., numbered from cathode
grid, suppressor: use subscript $_{su}$ or $_{g3}$, etc., numbered from cathode
liquid, reference to: attach subscript $_L$ to symbol
maximum: attach subscript $_m$ or $_{max}$ to symbol
minimum: attach subscript $_{min}$ to symbol
monochromatic: attach subscript λ to symbol
normal (perpendicular), reference to: attach subscript $_n$ to symbol
plate, reference to: attach subscript $_p$ to symbol
reduced properties (fluids): attach subscript $_r$ to symbol
solid, reference to: attach subscript $_X$ to symbol (*x*tal)
source, reference to: attach subscript $_s$ to symbol
spectral or monochromatic: attach subscript λ to symbol
transition between polymorphic forms, reference to: attach subscript $_t$ to symbol
vapor or gas, reference to: attach subscript $_G$ to symbol

(*Continued on following page.*)

FINDING INDEX TO STANDARD LETTER SYMBOLS AND ABBREVIATIONS

In the following table the numbers to the right of a given letter-symbol indicate the positions in the preceding table where that symbol is used. Thus, $\mathfrak{A}$ is to be found in No. 482 where it is used as the symbol for the "magnetic vector potential."

GAS CONSTANT

Values of R in $PV = RT$ for one mole of ideal gas, selected from *A. P. I. Research Project* 44.

1 Bar = 10^6 dyne/sq cm = 0.987 atm. 1 Kg/sq cm = 0.968 atm.

1 Atm = 760 mm of Hg = 29.921 inches of Hg = 14.696 lb/sq in. abs = 1.01325 bar = 1.03328 kg/sq cm.

Gram molar volume of ideal gas at 1 atm and 0°C = 22,414.6 cc = 22.4140 liters.

Pound molar volume of ideal gas at 1 atm and 32°F = 359.05 cu ft.

Ice point = 0°C = 273.16°K = 32°F = 491.69°R.

1 Calorie (thermochemical) = 4.1833 intern. joules.

1.8 Btu/lb = 1.0 Chu/lb = 1.0 IT cal/g = 1.000657 cal/g.

1 Horsepower = 550 ft-lb/sec = 745.575 intern. watts.

1 Liter = 1000.27 cc.

COMMON PHYSICAL CHEMISTRY EQUATIONS

By Frank Hovorka, Ph. D.

Gases

1. Molecular weight, volume, and temperature.

Perfect Gas Law: $PV = \frac{W}{M}RT$

Van der Waals' Equation: $\left[P + \frac{a}{V^2}\left(\frac{W}{M}\right)^2\right]\left[V - b\frac{W}{M}\right] = \frac{W}{M}RT$

Berthelot's Equation: $PV = \frac{W}{M}RT\left[1 + \frac{9}{128}\frac{P}{Pc}\frac{Tc}{T}\left(1 - 6\frac{Tc^2}{T^2}\right)\right]$

R is a constant independent of the nature of the gas and must be expressed in the same units as the pressure and the volume. It has the following values:

$R = 0.08205$ liter-atmospheres per degree per mole
82.05 cc-atmospheres per degree per mole
8.314 joules per degree per mole
1.987 calories per degree per mole
8.314×10^7 ergs per degree per mole

P, V, T, M, and W are the pressure, volume, absolute temperature, molecular weight, and the mass of the gas respectively. Pc and Tc are the critical pressure and the critical absolute temperature; a and b are individual constants that must be determined empirically for each substance. (See critical temperature and volume.) When V is in cubic centimeters then b must be expressed in cubic centimeters per molecular weight. When P is in atmospheres a must be in cc^2-atmospheres per molecular weight.

2. Critical temperature, pressure, and volume.

$$Pc = \frac{a}{3Vc^2} \qquad Tc = \frac{8PcVc}{3R}$$

$$Vc^3 = \frac{ab}{Pc} \qquad a = 3PcVc^2 \qquad b = \frac{Vc}{3}$$

Vc is the critical volume. For explanation of the other terms see part (1).

3. Effusion of Gases. $c = \sqrt{\frac{3PV}{mn}} = \sqrt{\frac{3RT}{M}} = \sqrt{\frac{3P}{d}}$

c is the root mean square velocity; m is the mass of each molecule; n is the number of molecules in a volume V at the pressure P or at the temperature T. When c is in centimeters per second, m is expressed in grams, V in cubic centimeters, P in dynes per square centimeter and R in ergs; d is the density; M is the molecular weight.

COMMON PHYSICAL CHEMISTRY EQUATIONS

Graham's Law: $\frac{c_1}{c_2} = \sqrt{\frac{d_2}{d_1}} = \sqrt{\frac{M_2}{M_1}}$

c_1 and c_2, d_1 and d_2, M_1 and M_2 are the root mean square velocities, densities, and molecular weights of the two gases under consideration.

$$\frac{t_1}{t_2} = \frac{c_2}{c_1} = \sqrt{\frac{M_1}{M_2}}$$

t_1 and t_2 are the times of passage of each gas under a given pressure through an orifice. For an explanation of the other terms in the equation see the preceding equation.

$$\bar{n} = n\sqrt{\frac{RT}{2\pi M}}$$

$\bar{n}$ is the number of molecules striking a surface per square centimeter per second; n is the total number of molecules per cubic centimeter; M is the molecular weight; T is the absolute temperature; R is expressed in ergs per degree and is equal to 8.315×10^7 ergs.

4. Dissociation. $\alpha = \frac{d_1 - d_2}{d_2(n-1)} - \frac{M_1 - M_2}{M_2(n-1)} - \frac{V_2 - V_1}{V_1(n-1)}$

d_1, M_1, and V_1 are respectively the density, the molecular weight, and the volume of the undissociated gas; d_2, M_2, and V_2 are respectively the density, the apparent molecular weight, and the volume of the dissociated gas at the same temperature; α is the degree of dissociation, and n is the number of particles into which a molecule dissociates.

5. Adsorption.

Freundlich's Isotherm: $\log \frac{x}{m} = k + \frac{1}{n} \log P$

x is the mass of the gas absorbed; m is the mass of the absorbent; k and n are experimentally determined constants; P is the pressure of the

Langmuir's Equation: $\frac{P}{x} = a + bP$

x is the number of gram molecules adsorbed per square centimeter at a pressure P; a and b are experimentally determined constants.

Liquids

1. Viscosity. $\frac{n_1}{n_2} = \frac{d_1 t_1}{d_2 t_2}$

n_1 and n_2, d_1 and d_2, t_1 and t_2 are respectively the absolute viscosities, densities, and times of flow in seconds of the two liquids through the same capillary at the same temperature and pressure; $\frac{n_1}{n_2}$ is the relative viscosity where n_2 usually refers to water.

2. Surface tension. $\gamma = \frac{1}{2}hdgr$

γ is the surface tension in dynes per centimeter, h is the height in centimeters to which a liquid of the density d rises in a capillary of the radius r (in centimeters); g is the gravitational constant expressed in centimeters per sec.^{2}

Molecular Surface Energy: $\gamma\left(\frac{M}{d}\right)^{2/3} = k(t_c - t - 6)$

M, d, and t_c are respectively the molecular weight, density, and the critical temperature of the liquid; t is the experimental temperature; k is the constant (Eötvos constant) equal to 2.12 for unassociated liquids.

Molecular Weight: $M = \left[\frac{k(t_2 - t_1)}{\gamma_1 d_1^{-2/3} - \gamma_2 d_2^{-2/3}}\right]^{3/2}$

γ_1 and γ_2, d_1 and d_2 are respectively the surface tensions and densities of a liquid at the temperature t_1 and t_2 respectively.

Eötvos Constant: $k = \frac{\gamma_1\left(\frac{M}{d_1}\right)^{2/3} - \gamma_2\left(\frac{M}{d_2}\right)^{2/3}}{t_2 - t_1}$

For explanation of the terms in this equation see equations on molecular surface energy and molecular weight.

Association: $x = \left(\frac{2.12}{k}\right)^{3/2}$

x is the degree of association.

Gibbs Adsorption Equation: $\mu = -\frac{C}{RT} \times \frac{d\gamma}{dC}$

μ is the excess of solute per unit surface or interface; C is the concentration of the solute, and $\frac{d\gamma}{dC}$ is the rate at which surface tension changes with concentration.

Sugden's Parachor: $P = \frac{m}{D - d} \times \gamma^{1/4}$

P is the parachor of the liquid under consideration, m is its molecular weight, D its density, γ its surface tension, and d the density of its saturated vapor (d may be neglected at low pressures).

3. Boiling Point and the Heat of Vaporization.

The Law of Ramsay and Young: $\frac{T_A}{T_B} = \frac{T_{A1}}{T_{B1}} + C(T_{A1} - T_A)$

T_A and T_B are the absolute boiling points of the substances A and B under the same pressure. T_{A1} and T_{B1} are the corresponding boiling points under another pressure. C is a constant. This relation holds very closely for related substances for which C is practically zero.

COMMON PHYSICAL CHEMISTRY EQUATIONS

Heat of Vaporization. *Trouton's Rule*: $\frac{\Delta H}{T} = 21$

Nernst-Bingham Rule: $\frac{\Delta H}{T} = 17 + 0.011T$

ΔH is the heat of vaporization per molecular weight and T its absolute boiling point under one atmosphere of pressure.

Both rules hold quite well for non-associated liquids.

4. Index of Refraction.

Lorenz and Lorentz Equation: $\frac{n^2 - 1}{n^2 + 2} \times \frac{1}{d} = r$

n is the index of refraction, d the density, and r the specific refraction.

Solutions

1. Vapor Pressure. Raoult's Law: $P = P_0 X_0$

P is the vapor pressure of the solvent or volatile solute over its solution; X_0 is the mole fraction and P_0 is the vapor pressure of the pure solvent or the volatile solute at the same temperature as the solution.

2. Molecular Weight of Solutes.

Rise of Boiling Point: $M = 1000 K_b \frac{g}{G \Delta T_b}$

Lowering of the Freezing Point: $M = 1000 K_f \frac{g}{G \Delta T_f}$

Lowering of the Vapor Pressure: $M = \frac{gm}{G} \times \frac{P}{P_0 - P}$

M is the molecular weight of the solute, g is the mass of the solute and G is the weight of the solvent. K_b and K_f are the molal boiling point and molal freezing point constants. T_b and T_f are the experimental boiling point raising and freezing point lowering respectively. m is the molecular weight of the solvent, P_o is the vapor pressure of pure solvent and P is the vapor pressure of the solvent from its solution at the same temperature.

3. Conductivity.

Resistance: $R = \frac{E}{I}$

R is the resistance in ohms, E the voltage and I the amperage.

Conductance: $L = \frac{1}{R}$

L is the conductivity in reciprocal ohms; R is the resistance in ohms.

COMMON PHYSICAL CHEMISTRY EQUATIONS

Specific Conductivity: $\overline{L} = \frac{l}{A} \times L$

$\overline{L}$ is the specific conductivity, l is the distance between the electrodes, A the area of the electrodes, and L is the conductivity in reciprocal ohms.

Cell Constant: $K = \frac{A}{l}$

K is the cell constant; l is the distance between the electrodes and A the area of the electrodes.

Equivalent Conductivity: $\Lambda = \frac{1000\overline{L}}{C}$

Λ is the equivalent conductivity, $\overline{L}$ is the specific conductivity, and C is the normality of the solute.

Thermodynamics

1. First Law of Thermodynamics: $\Delta E = q - W$

ΔE is the change of internal energy of a system, q is the heat absorbed by the system, and W is the work done by the system against the surroundings.

Work Done by an Ideal Gas During Expansion:

(1) Against constant external pressure: $W = P(V_2 - V_1)$

(2) Against variable external pressure:

$$W = RT \ln \frac{V_2}{V_1} = RT \ln \frac{P_1}{P_2}$$

W is the work done, and P is the external pressure. P_1, V_1, P_2, V_2 are the initial and final pressures and volumes. If P is expressed in atmospheres and V is expressed in cubic centimeters, then W is in cc-atmospheres. One calorie is equal to 41.3 cc-atmospheres. When R is in calories then the term W (in 2) is in calories regardless of the units of V or P.

2. Effect of Temperature on Equilibrium.

In all of the following equations ΔH is positive when heat is absorbed.

Clapeyron Equation: $\frac{dP}{dT} = \frac{\Delta H}{T(V_2 - V_1)}$

$\frac{dP}{dT}$ is the rate of change of vapor pressure of a pure substance with temperature. V_1 and V_2 are the initial and final volumes. ΔH is the amount of heat absorbed by the substance undergoing a change of phase. T is the absolute equilibrium temperature of the two phases. When P is in atmospheres and V in cubic centimeters, ΔH must be in cc-atmospheres. (One calorie = 41.3 cc-atmospheres.) Likewise when V_1 refers to one gram of a substance, V_2 and ΔH also must refer to one gram.

COMMON PHYSICAL CHEMISTRY EQUATIONS

Clausius-Clapeyron Equation: The following equation is applicable to vaporization and sublimation only: $$\ln \frac{P_1}{P_2} = \frac{\Delta H}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

P_1 and P_2 are the vapor pressures at absolute temperatures T_1 and T_2 respectively. ΔH is the molecular heat of vaporization or sublimation. If R is in calories, ΔH will be in calories regardless of the units of pressure.

$$\ln \frac{C_1}{C_2} = \frac{\Delta H}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

C_1 and C_2 are the solubilities of a substance (in any units) at the absolute temperature T_1 and T_2. ΔH is the molecular heat of solution. When R is expressed in calories, then ΔH must be expressed in calories.

Van't Hoff's Isochore: $$\ln \frac{K_{c1}}{K_{c2}} = \frac{\Delta H}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

$$\ln \frac{K_{p1}}{K_{p2}} = \frac{\Delta H}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

All K_c and K_p values are obtained by placing the products in the numerator and the reactants in the denominator. K_{c1} and K_{p1} are the equilibrium constants at absolute temperature T_1; K_{c2} and K_{p2} are the equilibrium constants at absolute temperature T_2. ΔH is the heat of reaction for that reaction on which K_c and K_p are based. When R is in calories ΔH must also be in calories.

Free Energy and Equilibrium Constant: $$\Delta F^0 = -RT \ln K_p$$

ΔF^0 is equal to the change in free energy for a reaction in which the reactants are in their standard states (1 atmosphere) and are converted into products at 1 atmosphere.

Nernst Heat Theorem: $$\log K_p = -\frac{\Delta H}{4.58T} + \Sigma n(1.75 \log T) + \Sigma(nc)$$

ΔH is the heat of reaction at the absolute temperature T. Σn is equal to the number of moles of gaseous products minus the number of moles of gaseous reactants. $\Sigma(nc)$ is the sum of the Nernst constants; it is equal to the sum of individual constants (each constant must be multiplied by the number of moles of that substance) for gaseous products minus the sum of constants for gaseous reactants. For the values of Nernst constants see Taylor, *Treatise on Physical Chemistry*, p 586 (1931). In cases where the constant has not been determined for a particular substance, 3 to 3.2 may be used as a fair approximation.

Rates of Reaction

1. Unimolecular Reaction: $$k = \frac{1}{t}\ln\left(\frac{a}{a-x}\right)$$

$$t_{1/2} = \frac{0.693}{k}$$

k is the velocity constant, a is the initial concentration, $(a - x)$ is the concentration remaining after the time t, x is the amount reacting in the time t, and $t_{1/2}$ is the period of half life of a unimolecular reaction.

2. Bimolecular Reaction.

(1) When equimolecular quantities (a and b) of the initial substance are used:

$$k = \frac{1}{t} \times \frac{x}{a(a-x)}$$

(2) When other than equimolecular quantities of the initial substances are used:

$$k = \frac{}{t(a-b)} \ln \frac{b(a-x)}{a(b-x)}$$

3. Influence of Temperature on the Rate of Reaction.
Arrhenius Equations:

$$\frac{d \ln k}{dt} \qquad \frac{E}{RT^2}$$

$$\ln \frac{k_1}{k_2} = \frac{E}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

E represents the energy of activation per gram mole of a substance; k_1 and k_2 are the specific reaction rates at absolute temperatures T_1 and T_2 respectively; R is the gas constant.

Electromotive Force

1. Variation with Temperature: $E = T\left(\frac{dE}{dT}\right) - \frac{\Delta H}{nF}$

E is the electromotive force of a system; n is the change in valence of the ion causing the potential difference; F is equal to the charge carried by gram ion or is equal to 23,060 calories; $\frac{dE}{dT}$ is the rate of change of electromotive force with temperature; T is the experimental absolute temperature; ΔH is the heat of reaction.

2. Concentration Cell.

(1) *Without transference*: $E = \frac{RT}{nF} \ln \frac{C_1}{C_2}$

(2) *With transference*: $E = \left(\frac{2\mu}{\mu + v}\right)\frac{RT}{nF} \ln \frac{C_1}{C_2}$

μ and v are the velocities of the positive and negative ions respectively; C_1 and C_2 are the concentrations (in any units); the velocity of the faster ion is inserted in the numerator. See part 1 for the explanation of the other terms.

DEFINITIONS OF CHEMICAL, PHYSICAL, AND PHARMACEUTICAL TERMS

Most crude drugs are not suitable for administration in their natural state being either too bulky or too nauseous. Preparations suitable for administration are therefore prepared from them by the pharmacist. Brief definitions for the more common pharmaceutical preparations are given.

Therapeutic terms are employed to designate the effect of drugs when applied as remedial agents in the treatment of disease. In the cases of drugs which are cited as illustrations, it should be especially noted that most drugs have several distinct therapeutic effects, the effect cited being but one of the several characteristic of the drug. In selecting the examples an attempt has been made to cite one or two drugs which exhibit the therapeutic effect described. In certain cases of diseases many drugs are contraindicated because of certain other therapeutic activities and for this reason the following brief descriptions should not be considered as aids to self medication.

Absolute Zero—The beginning or zero point in the absolute (thermodynamic) temperature scale. According to the kinetic theory of heat, it represents the temperature at which all thermal motion ceases. It is equal to −273.18°C. or −459.72°F.

Absorption, Heat of—The heat evolved when a given amount of a substance is absorbed.

Aceta (Vinegars)—Liquid preparations made by extracting the drug with diluted acetic acid and filtering.

Acetyl Number (value)—A number or value which indicates the extent to which a substance may be acetylated. In the analysis of fats, oils, etc., it is taken as the measure of the amount of hydroxy acids and higher alcohols which are present since other substances ordinarily present are not affected by the acetylating agent. It is expressed in milligrams of potassium hydroxide required to neutralize the acetic acid liberated from one gram of acetylated fat or oil.

Acetylene—Any open chain hydrocarbon containing one or more triple bonds; specifically the hydrocarbon CH:CH, in distinction from diacetylene, triacetylene, etc., with two, or three, etc., respectively, triple bonds.

Acid—Any chemical compound containing hydrogen capable of being replaced by positive elements or radicals to form salts. In terms of the dissociation theory, it is a compound which on dissociation in solution yields excess hydrogen ions.

Acid Number (value)—A number or value which indicates the amount of free acids present in a substance. In the analysis of fats, oils, etc., it is expressed by the number of milligrams of potassium hydroxide which are required to neutralize the free fatty acids in a gram of substance.

Active Mass—A term used in connection with the law of mass action. Guldberg and Waage defined the term as the molarity of the reacting substance, or its partial pressure. Expressed in this form, the law of mass action is only approximately correct. To make the law exact, "activities" must be substituted for molarities and "fugacities" for partial pressures.

Activity—A thermodynamic term denoted by *a*. Activities are *effective* concentrations and have the dimensions of concentrations. When activities are employed in a mass law expression the equilibrium constant has a fixed value.

Activity Coefficient—A factor which, when multiplied by the molecular concentration, yields the active mass. The activity coefficient is evaluated by thermodynamic calculations, usually from data on the emf of certain cells, or the lowering of the freezing point of

certain solutions. It is a correction factor which makes the thermodynamic calculations correct.

Additive Property—A property, the numerical value of which is equal to the sum of the values for the component parts and which depends only on the number and kinds of molecules or atoms present without any regards to their arrangements; e.g., the molecular weight, which is the sum of the weights of the component atoms.

Adiabatic Process—A process carried out in such a way that no heat is absorbed or evolved by a system.

Adsorption—A surface phenomenon exhibited by solids which consists in the adhesion, in an extremely thin layer, of the molecules of gases, of liquids, or of dissolved substances with which they are in contact.

Alcohol—Any one of a class of compounds which are analogous to ethyl alcohol in constitution in that they are hydroxides of organic radicals; specifically, the term is applied to ethyl alcohol.

Aldehyde—Any one of a class of organic compounds intermediate in oxidation between a primary alcohol and a carboxylic acid, having two hydrogen atoms less than the alcohol, and characterized by the radical $-CH:O$; specifically, the term aldehyde is applied to acetaldehyde, CH_3CHO.

Alicyclic—See *cyclic.*

Aliments (Foods)—Substances which maintain some vital process or renew some structural material. They may be vegetable, animal, or mineral in origin and are either *oxidizable* (sugar, starch), *nitrogenous* (albumin), or *unoxidizable* (water, inorganic salts). See *restoratives.*

Alkali—Any compound having marked basic properties; see *base.*

Alkalinity—The combining power of a base measured by the maximum number of equivalents of an acid with which it can react to form a salt. In water analysis, it represents the carbonates, bicarbonates, hydroxides, and occasionally the borates, silicates, and phosphates in the water and is determined by titration with standard acid to certain standard datum points and expressed as milligrams of calcium carbonate per liter (nearly the same as "parts per million").

Alkaloid—An alkaline, nitrogenous organic substance (i.e., an organic base) with marked physiological action. The term is usually restricted to substances which occur naturally in plants and animals; e.g., nicotine, quinine, etc.

Alloy—The product formed by the blending of a metal with other metals or non-metals usually by fusion and solution in each other when molten.

Alpha Radiation—The radiation of doubly positively charged particles, called *alpha particles*, emitted during certain radioactive transformations. These particles have a mass of 4.00 and are identical with the nuclei of helium atoms.

Alteratives—Drugs which alter or change morbid conditions by furthering metabolism or modifying nutritive processes (sarsaparilla). As most alteratives promote absorption of inflammatory deposits they are also called *resolvents* or *discutients.*

Ampere—The practical unit of intensity of electric current being defined by U. S. statute as the unvarying current which, when passed through a standard solution of silver nitrate in water, deposits silver at the rate of 0.001118 grams per second. It is equal to the current produced by an electromotive force of one volt flowing through a circuit of one ohm resistance.

Ampullae (Ampuls)—Hermetically sealed containers filled with a sterilized medicinal liquid intended for

hypodermic or intravenous injection. They are usually made of glass which should be of high quality especially in regard to its resistance to water.

Analgesics (Anodynes)—Drugs which relieve pain by either (*a*) depressing sensory nerve centers, or (*b*) impairing nerve-fiber conductility (opium, belladonna, antipyrine). See *cerebral depressants*.

Anaphrodisiacs—Substances which lessen sexual functions and appetite, by diminishing excitability of the nerves of the genital organs or by depressing the genital centers in the brain and spinal cord, or by decreasing local circulation (bromides, camphor).

Androgenic –Favoring masculine characteristics.

Anesthetics—Drugs which abolish sensation either by depression of the central nervous system (*general anesthetics*, ether, chloroform) or by decreasing the ability of peripheral nerve structures to receive or conduct nerve impulses (*local anesthetics*, novocain). See also *cerebral depressants*, and *sedatives*.

Angstrom—A unit of length, used especially in expressing the length of light waves, equal to one ten-thousandth of a micron, or one hundred-millionth of a centimeter (1×10^{-8}cm.)

Anhydrotics—Drugs which check perspiration by reducing the action of the sweat glands, the excitability of the sweat centers, or the circulation in the skin (pilocarpine, belladonna).

Anhydrous—A term meaning without water. It is usually applied in referring to the absence of water of crystallization.

Animal Oil—An oily material obtained, in any manner of various ways, from animal substances. It usually refers to a mixture of the glyceryl esters of various organic acids although it is also applied to substances other than glycerides; e.g., bone oil, which is a mixture containing pyrrole, pyridine, quinoline, amines, and other nitrogenous compounds, as well as hydrocarbons, etc., which are obtained on the destructive distillation of bones.

Anion—The charged particle in a solution of an electrolyte which, under the influence of an electrical potential, moves toward the anode. It is the negatively charged ion.

Anode—The electrode at which an oxidation process occurs. It is the negative pole of a battery, or the positive pole of a solution of an electrolyte through which current is being forced. In a vacuum tube, the anode is the electrode towards which the electrons flow within the tube.

Anodynes—See *analgesics*.

Anthelmintics—Drugs which destroy (*vermicides*) or expel (*vermifuges*) intestinal worms (vermifuges: castor oil, jalap; vermicides for: (*a*) thread worms —alum, tannin, quassia, and (*b*) round worms—santonin, chenopodium, and (*c*) tape worms (*taenifuges*)—aspidium).

Antiemetics—Drugs which lessen nausea and vomiting. If the action is a sedative one on the end organs of the gastric nerves it is said to be *local* (bismuth sub-nitrate); if the irritability of the vomiting center in the medulla is reduced the action is *general* (chloral).

Antihydrotics—See *anhydrotics*.

Antilithics—Drugs which are supposed to prevent the formation of urinary and biliary concretions in the excretory passages (alkaline salts).

Antimonial—A medicine containing the element antimony.

Antiperiodic—Drugs which prevent recurrence of certain periodic febrile diseases usually by arresting further

DEFINITIONS OF TERMS

development of successive crops of pathogenic organisms in the blood (cinchona).

Antiphlogistics—Drugs which reduce inflammation of serous membranes (mercury, opium).

Antipyretics (Febrifuges)—Drugs which reduce abnormally high body temperature. This may be accomplished either by decreasing heat production (by lessening tissue change or reducing circulation) or by increasing heat loss (by dilating skin vessels or causing perspiration) (quinine; acetanilide).

Antiscorbutic—A remedy for the treatment or prevention of scurvy (lemon juice, vitamin C).

Antiseptic—A substance which prevents or retards septic decomposition by killing bacteria or arresting their development (mercuric chloride, phenol). See *antizymotics*.

Antispasmotics—Drugs which relax spasm (belladonna, lobelia). See *cerebral excitants*.

Antitoxin—A serum employed hypodermically for the treatment or prevention of those diseases caused by bacterial toxins (diphtheria antitoxin).

Antivenin—A serum used hypodermically to counteract or neutralize snake venom.

Antizymotics—Drugs which arrest fermentation dependent upon organic ferments (enzymes) or organized ferments (yeasts, bacteria). Antizymotics are usually classified into (*a*) antiseptics, (*b*) disinfectants, and (*c*) deodorants.

Aperients—See *laxatives*.

Aphrodisiacs—Drugs which stimulate sexual appetite by acting directly or reflexly upon the cerebral or spinal genital center (strychnine, cannabis, alcohol).

Aquae (Aquae Aromaticae; Aromatic Waters)—Preparations made by impregnating distilled water with volatile substances. Aromatic waters when prepared from volatile oils are intended to be, as nearly as possible, saturated solutions. They must be clear and free from solid particles. They are prepared either by distillation or solution.

Aqueous Tension—The vapor pressure of pure water, or the partial pressure of water vapor over any aqueous solution or solid hydrate, at any given temperature.

Aromatics—See *carminatives*.

Arsenicals—Medicines containing the element arsenic.

Astringents—Drugs which contract muscular fiber by direct irritation and sometimes condense tissues by precipitating albumin and gelatin (alum, tannin).

Athermanous—Not transmitting radiant heat; not *diathermanous* (q.v.).

Atom—According to the atomic theory, the smallest quantity of an element which is capable of entering into chemical combination or that can exist alone.

Atomic Number—A number, characteristic of an element, which designates the position of the element in the periodic table. It represents the net positive charge on the nucleus of each atom, or the number of electrons outside of the nucleus.

Atomic Radius—The radius of the volume occupied by an atom. This volume may approximate a sphere or, in many cases, a highly distorted sphere. In a given crystal, the atomic radii when added together equal the inter-atomic distances within the crystal. The ionic

DEFINITIONS OF TERMS

radius of the same species of atom will be somewhat less, or greater, than that of the atomic radius because the outermost shell of electrons has been stripped off, or increased, in the formation of the ion.

Atomic Theory—A theory postulating that all elements are composed of small discrete unit particles called atoms. The atoms of any one element are supposed to be of the same size and essentially of the same weight, but differ in both from element to element. Chemical combination is the union of atoms of various elements into the smallest discrete entities of the compound; viz., the molecules.

Atomic Weight—The relative weight of the atom of an element, referred to some element taken as a standard. An atomic weight of 16 for oxygen is the one usually adopted as a basis for reference.

Average Life—In radioactivity, the reciprocal of the radioactive constant (q.v.).

Avogadro's Hypothesis—The hypothesis that equal volumes of all gases, under the same conditions of temperature and pressure, contain equal numbers of molecules.

Avogadro's Number—The number representing the number of molecules in one gram-molecular weight of any substance, as for oxygen, the number in 32 grams. It is equal to 6.0228×10^{23}.

Base—A compound of a metal, or a metal-like group, with hydrogen and oxygen in the proportion to form an OH radical, which ionizes in aqueous solution to yield hydroxyl ions. A base is formed when a metallic oxide reacts with water.

Beta Radiation—See *radioactivity*.

Bicyclic—Containing two rings in the molecule, usually fused rings as in naphthalene.

Boiling Point—The temperature at which the vapor pressure of a liquid becomes equal to the external pressure. This temperature differs for the same liquid under different pressures. The *normal boiling point* is the temperature at which the vapor pressure reaches 760 mm of mercury.

Boiling Point, Molal Elevation of—See *molecular elevation*.

Bougies (Pencils)—Small solid cylinders impregnated with various drugs for insertion into the urethra, uterus, or nose. They are made of gelatin, glycerogelatin, or oil of theobroma.

Boyle's Law—The law that the volume of any gas varies inversely as the pressure upon it, providing the temperature is kept constant. It is also known as *Mariotte's law*.

Brinell Hardness—A value of the hardness of a material obtained by pressing a hardened ball, having a diameter of 10 mm, into the surface of the specimen to be tested. The weight applied to steels is 3000 kg for 30 seconds; to brasses and bronzes 500 kg for 60 seconds. The diameter of the impression forms the basis for calculating hardness.

British Thermal Unit (btu)—The quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit at, or near, its point of maximum density (39.1°F.) The btu is equivalent to 0.252 kilogram-calorie.

Buffer—Any substance, or combination of substances, which when dissolved in water produces a solution which resists a change in its hydrogen ion concentration upon the addition of acid or alkali.

Cachets (Wafers; Konseals)—Various sized, concave wafers made of unleavened bread or starch paper; the cavity, formed by moistening the concave edges of two and pressing them together, containing the drug.

DEFINITIONS OF TERMS

Calorie—The small calorie (*c*) is an energy unit used to measure the quantity of heat. It is equal to the amount of heat required, at a pressure of one atmosphere, to raise the temperature of one gram of water one degree Centigrade. Since the specific heat of water varies with the temperature, the rise of one degree is sometimes specified to be between certain temperature intervals (as from 0° to 1°C.; at or near the temperature of greatest density, which is 4°C.; or, at from 15° to 16°C., in which case the unit is almost exactly that of the *mean calorie*). The amount of heat required to raise one gram of water from 0° to 100°C. is the *rational calorie*, one hundredth of the rational calorie being called the *mean calorie*.

Capsulae (Capsules)—Various sized transparent casings (short tubes, usually with one open end fitting over that of another) of gelatin. They are either hard, or soft and elastic, and are used for the administration of nauseous or disagreeable solids or liquids.

Carbocyclic—See *cyclic*.

Carbohydrate—Any one of a group of compounds composed of carbon, hydrogen, and oxygen with the ratio of hydrogen to oxygen usually as in water; viz., 2H:1O. They are neutral compounds comprising the sugars, starches, celluloses, pentosans, galactans, etc.

Cardiac Depressants (Cardiac Sedatives)—Drugs which lessen the force and frequency of the heart's action and control its over-action and palpitation (aconite, veratrum viride).

Cardiac Stimulants (Cardiac or Heart Tonics)—Drugs which stimulate the cardiac muscle, slow and strengthen its contractions (digitalis).

Carminatives (Aromatics)—Drugs which expel gases from the stomach and intestines by increasing peristalsis, by stimulating the circulation, and by relaxing the pyloric and cardiac orifices (peppermint, cardamon seed).

Catalyst or Catalytic Agent—Any substance which, by virtue of its presence affects the rate of a chemical reaction and which may be recovered practically unchanged at the end of the reaction. The term *contact agent* is often applied to a solid catalyst in contact with gaseous reactants.

Cataplasmata (Poultices)—Soft pasty masses for external application of moist heat, with or without the addition of active medicaments. Substances commonly employed in the preparation of poultices are bran, flaxseed meal, kaolin, glycerol, and oatmeal. Glycerol or fixed oil is added to prevent caking.

Cathartics—See *purgatives*.

Cathode—The electrode at which reduction occurs. It is the negative electrode in a cell through which current is being forced, but it is the positive pole of a battery. In a vacuum tube, the cathode is the electrode from which electrons are liberated; see also the term *anode*.

Cation—The charged particle in the solution of an electrolyte which, under the influence of an electrical potential, moves toward the cathode. It is the positively charged ion.

Causticity—A measure of the hydrogen ion concentration in a sample of water; see *hardness*.

Caustics—See *escharotics*.

Cell (galvanic or electromotive)—A combination made up of a cup, or other vessel, containing a solution of a suitable electrolyte and two suitable electrodes which dip into it. It may be used either for generating electricity by chemical action, or for use in electrolysis (in the latter case it is called an *electrolytic cell*).

Cellulose—An anhydroglucose polysaccharide which constitutes the major portion of plant materials and which can be hydrolyzed by acid into glucose. *Alpha cellulose* is the cellulosic fraction

DEFINITIONS OF TERMS

which is insoluble in aqueous 17.5% sodium hydroxide solution. *Beta cellulose* is the cellulosic fraction which is soluble in aqueous 17.5% sodium hydroxide solution and from which it can be precipitated by acidifying the solution. *Gamma cellulose* is the cellulosic fraction which is soluble in aqueous 17.5% sodium hydroxide solution in which it remains dissolved, even after the solution is acidified.

Ceramic—Pertaining to the manufacture, or the products therefrom, of material made from earth by the agency of fire, such as pottery, enamel, cement, glass, etc. For definitions of ceramic terms see special *glossary of ceramic terms*.

Cerata (Cerates)—Adhesive preparations for external use containing wax which are capable of being spread at ordinary temperatures and do not melt at body temperature.

Cerebral Depressants—Drugs which lower or suspend the higher brain functions usually after a preliminary stage of excitement. Cerebral depressants or cerebral sedatives are usually classified as follows: (*a*) narcotics; (*b*) hypnotics; (*c*) analgesics; and (*d*) anesthetics; see these latter terms.

Cerebral Stimulants (Cerebral Excitants; Antispasmotics)—Drugs which increase the functional activity of the brain without causing subsequent depression of the cerebral functions (caffeine, valerian).

Cetane Number—This is a number which is a measure of the "ignition quality" of a Diesel fuel. It represents the percentage by volume of normal cetane (hexadecane) in a mixture with alpha-methylnaphthalene which gives the same ignition lag as the fuel to be rated when tested under standard conditions. Thus, by definition, alpha-methylnaphthalene has a cetane-number rating of zero, and normal cetane of 100. The cetane number is reported to the nearest whole number. Cf. ASTM Standards of Petroleum Products and Lubricants No. D-613-43T (CRC F-5-543) Method of Test for Ignition Quality Diesel Fuels.

Charles' Law—The law that at constant pressure the volume of a gas varies directly as the absolute temperature. The variation in volume amounts to 1/273 of its volume at 0°C. for each degree Centigrade.

Chemical Equivalent—See *equivalent weight*.

Chemiluminescence—See *luminescence*.

Cholagogue—See *purgatives*.

Ciliary Excitants—Drugs, which when dissolved in the saliva, increase bronchial mucous expectoration, usually through reflex action on the bronchial and tracheal cilia (ammonium chloride, acacia).

Clysters—*See enemata*.

Colligative Property—A property depending only upon the number of atoms or molecules present in a system and not upon the nature of the atoms or molecules; e.g., gaseous pressure is a colligative property.

Collodia (Collodions)—Preparations for external use, either simple collodion (a solution of nitrocellulose in ether or alcohol), or simple collodion containing active medicinal substances. They form a protective film over the skin due to the rapid evaporation of the solvent.

Colloid—A state of subdivision of matter characterized by a particle size intermediate between molecular dispersion (true solution), and a size just about visible with an ordinary microscope; i.e., from 10^{-5} to 10^{-7} cm in diameter. A colloidal substance, when apparently dissolved in a liquid, diffuses not at all or very slowly through a membrane and shows no pronounced effect on the

DEFINITIONS OF TERMS

ing slough (mineral acids, sodium hydroxide, phenol). See *irritants*.

Essential Oil—Any one of a class of odoriferous, volatile liquids, insoluble in water, which are obtained from plants to which they impart odors and other characteristic properties. They are of various organic types, such as ethers, aldehydes, esters, etc., or mixtures of the same. Some contain dissolved resin and are known as *oleoresins*. They are sometimes called *volatile oils* in distinction from *fixed oils*.

Ester—A compound which may be regarded as formed by the replacement of the acid hydrogen of an acid, organic or inorganic, by a hydrocarbon radical. When the radical is not specified in the name, *ethyl* is often understood; e.g., acetic ester is ethyl acetate.

Ester Number (value)—The numerical difference between the saponification number and the acid number. It is a measure of the neutral fats (esters of the fatty acids) present.

Estrogenic—Favoring female characteristics, especially the development of estrus (heat); the estrogenic state is a component of the normal female endocrinological cycle.

Excito-motors—See *motor excitants*.

Exfoliation—The property possessed by substances which are capable of casting or throwing off from their surfaces scales, laminae, or splinters.

Expansion, Coefficient of—The ratio of the increase in length (linear coefficient), area (superficial), or volume (cubical) of a body for a given rise in temperature (usually from 0° to 1°C.) to the original length, area, or volume, respectively. These three coefficients are approximately in the ratio of 1:2:3. When not expressly specified, the cubical coefficient is usually intended.

Expectorants—Drugs which change the broncho-pulmonary mucous membrane secretion promoting its expulsion (ammonium chloride, senega, squill).

Explosive—A substance which acts by explosive chemical reaction to liberate, at high speed, gas and heat thus causing tremendous pressure.

Extracta (Extracts)—Pasty or semi-solid masses, or dry, solid or powdered products prepared by exhausting organic drugs with appropriate solvents and then carefully evaporating the solutions. Pasty or semi-solid extracts are usually referred to as *pilular extracts*.

Factor—A quantity by which a measure must be multiplied in order to express it in other terms. The number which is used to multiply a given weight of some compound in order to obtain the equivalent weight of some other compound is called a *gravimetric factor*; similarly, volumes may be interconverted by *volumetric factors*.

Faraday's Laws of Electrolysis—The law that: (1) For any electrolyte the amount of electrolysis is proportional to the quantity of electrical current which is passed through a solution; (2) for the same quantity of current passed through solutions of various electrolytes, the amounts liberated at the electrodes are directly proportional to chemical equivalents of the electrolytes. The quantity of current required to deposit one chemical equivalent weight is one *faraday* which is equal to 96,500 coulombs.

Fat—Any one of a class of compounds, composed of carbon, hydrogen, and oxygen, which are glyceryl esters of certain acids, such as stearic, palmitic, etc. The fats are neutral in reaction and on saponification all yield glycerol. The various varieties of natural fats are mixtures of different glycerides. A fat which is liquid at room temperatures is called a *fatty oil*. See *oil*.

Febrifuges—See *antipyretics*.

DEFINITIONS OF TERMS

Ferments—See *digestive ferments.*

Fixed Carbon—The percentage of combustible material in a sample (of coal usually) which is not volatile at 950°C.

Fixed Oil—An oil which is not readily volatile as distinguished from *volatile* or *essential oil* (q.v.). The term is especially applied to the liquid fats (glycerides) found in the fatty tissue of plants and animals, and in the seeds of plants. See *oil.*

Fluid—A substance which yields readily to any force which tends to alter its shape. Fluids possess no definite shape. The term includes both liquids and gases.

Fluidextracta (Fluidextracts)—Concentrated liquid preparations made from organic drugs by extracting with suitable solvents. The activity of one cubic centimeter of the fluid extract is adjusted to equal that of one gram of the drug. Various menstrua are employed, generally mixtures of alcohol and water, or mixtures of alcohol and water with glycerol or acids.

Fluorescence—The property of emitting radiation as the result of absorption of radiation from some other source. The emitted radiation persists only as long as the exposure is subjected to radiation which may be either electrified particles or waves. The fluorescent radiation generally has a longer wave length than that of the absorbed radiation. If the fluorescent radiation includes waves of the same length as that of the absorbed radiation it is termed resonance radiation. For laws, see *photochemistry.* See also *Raman effect.*

Foods—See *aliments*; *restoratives.*

Formation, Heat of—The heat evolved or absorbed when a compound is formed by direct union of its elements at some stated temperature. It is usually expressed in calories per gram-molecule of the compound.

Formula Weight—The sum of the atomic weights of all the atoms appearing in a chemical formula.

Free Energy—A thermodynamic term. Absolute values for free energy are unknown but when a system changes from one state to another at constant temperature and pressure, the decrease in free energy is numerically equal to the maximum useful work which can be done. This does not include work done on or by the atmosphere.

Freezing Point—The temperature at which a liquid solidifies. It is the temperature at which the liquid and solid states of a substance are in equilibrium at a given pressure (usually atmospheric). For pure substances it is identical with the melting point of the solid form.

Fusion, Latent Heat of—The amount of heat which must be supplied at the melting point to a unit quantity of a solid in order to transform it into a liquid at the same temperature (usually at standard pressure). The term is also called *heat of fusion.* It is usually expressed in calories per gram, or btu per pound.

Galactagogues—Drugs which increase lacteal secretion (pilocarpine, alcohol).

Gamma Radiation—A form of radiation emitted by certain radioactive substances. This radiation is similar to, but of shorter wave length than, X rays (about 10^{-8} to 10^{-9}cm). Like X rays, it is used in cancer therapy.

Gargarismata (Gargles)—Fluid preparations intended for gargling.

Gas—An aeriform fluid, having neither independent shape nor volume, but tending to expand indefinitely. Without qualification, the word is often popularly used to denote anesthetics, combustibles (gasoline), poisonous war materials, etc., whether liquids or solids at ordinary temperatures.

DEFINITIONS OF TERMS

Gas Constant—A general term for all gases, being the term R in the ideal gas law equation: $PV = nRT$. It is an energy term equal to 0.08205 liter-atmospheres per degree per mole; or, 1.987 calories per degree per mole; or, 8.314×10^7 ergs per degree per mole.

Gay-Lussac's Law of Volumes—The law that in gaseous reactions the volume of the combining gases, if at the same pressure, bear to each other, as well as to the product of the reaction, a simple whole numbered relationship. That is, the volume of the product is either equal to the sum of the volumes of the reactants or is less than, and bears a simple ratio to, this sum.

Germicides—See *parasiticides*.

Gibbs' Phase Rule—An equation advanced by Gibbs which defines the general conditions under which a system of several phases may be in heterogeneous equilibrium. It is: $F = C - P + 2$. Here F is the number of degrees of freedom of a system (i.e., the number of independent variables which must be fixed to completely define the system); C is the smallest number of components in terms of which the chemical composition of each phase may be described by means of a chemical equation; and P is the number of phases present at any stage.

Glucoside—Any one of a class of compounds, either natural or synthetic, which on hydrolysis yields a sugar, usually glucose, and one or more substances. Widely distributed in plants, they are generally white or colorless, crystalline compounds, often bitter, poisonous, and optically active. They are hydrolyzed by enzymes which are often present in the same plant from which they are obtained, by alkalies and by acids. Similar compounds derived from other aldose sugars or ketose sugars are called *aldosides* or *ketosides*, respectively.

Glycerita (Glycerites)—Solutions of a drug in glycerol; usually intended for external use.

Graham's Law of Effusion—The mean (root-mean-square) velocities of the molecules of two gases are inversely proportional to the square roots of their densities or of their molecular weights. If two gases are forced through the same small aperture, under the same pressure difference, then the rates of effusion (the time required for the same weight of each gas to pass through the aperture) are inversely proportional to the mean velocities of the molecules, and therefore directly proportional to the square roots of the molecular weights or of the densities.

Gram-atomic Weight—The mass, in grams, of an element equal numerically to its atomic weight.

Gram-molecular Weight—The mass, in grams, of an element or a compound equal numerically to its molecular weight.

Gravimetric Factor—See *factor*.

Grotthus, Law of—The law that only those rays of light which are absorbed produce chemical change.

Guldberg and Waage's Law—See *mass action law*.

Gum—Any one of a class of colloidal substances exuded by, or extracted from, plants. Gums are either soluble in water, or swell up and become glutinous when moist but harden on drying. The term is often applied to a variety of other plant exudations such as resins, gum resins, etc.

Half Period or Half Life—A term used in chemical kinetics to denote the time (in years, days, seconds, etc.) for half of a given initial quantity of material to decompose.

Hardness (of water)—The hardness or soap destroying power of water is due principally to the calcium and magnesium ions present in the water and is independent of the accompanying acid ions. The *total hardness* is measured in

terms of "parts per million" of calcium carbonate (more accurately milligrams of calcium carbonate per liter). It may be divided into two parts, the "temporary" and the "permanent" hardness. The *temporary hardness* is that part of the total hardness which is removed by boiling and corresponds roughly, but not quantitatively, to the calcium and magnesium bicarbonates in the water. The *permanent hardness* is that remaining after boiling and is due principally to the sulfates, chlorides, and nitrates of calcium and magnesium, and to the small amount of carbonates still held in solution. The total hardness also may be divided into the "alkalinity" or "carbonate" hardness and the "non-carbonate" hardness. The *alkalinity* of a natural water represents its content of carbonates, bicarbonates, hydroxides, and occasionally borates, silicates, and phosphates. It is determined by titration with dilute (usually 0.02 *N*) sulfuric acid to a methyl orange end point. Alkalinity is roughly equivalent to the temporary hardness. The difference between the total hardness and the alkalinity is the *non-carbonate hardness*, which is roughly equivalent to the permanent hardness. When the hardness of a water is greater than its alkalinity, the amount of hardness due to the alkalinity is called *carbonate hardness* and the amount of hardness in excess of this is called *non-carbonate hardness* or *incrustants*; when the hardness of a water is less than its alkalinity then the alkalinity, or part of the alkalinity, will be the *carbonate hardness* and the excess of the alkalinity over the hardness is called *negative non-carbonate hardness*. The *causticity* of a water is that part of its alkalinity due to hydroxides.

Heat Capacity—The *average* or *mean heat capacity* of a system, between any two given temperatures, is the quantity of heat required to raise the temperature of the system from the lower to the higher temperature divided by the difference between the two temperatures. The *true heat capacity*, c, at any given temperature is defined by the differential equation: $c = \left(\frac{q}{dT}\right)$, where q is the infinitesimal amount of heat required to change the temperature by an amount dT, at the given temperature. The heat capacity is usually determined either at constant pressure, or at constant volume. The heat capacity per gram is the *specific heat*. The heat capacity per mole is called the *molar heat capacity* (at constant pressure or volume).

Hehner Number (value)—A number expressing the percentage (i.e., grams per 100 grams) of water-insoluble fatty acids in an oil or fat.

Hematinics—Drugs which increase the amount of combined iron in the blood (iron salts, chalybeate waters).

Hemostatics—Substances which arrest hemorrhage (bleeding). Some authorities consider the word synonymous with styptics, others consider the word hemostatic as limited to those substances which are for internal application (ergot, ceanothus), whereas styptic signifies external use (alum, ferric chloride).

Henry's Law—The law that the solubility of a gas in a liquid is directly proportional to the pressure of the gas above the liquid at a definite temperature.

Hess' Law of Heat Summation—The law that the quantity of heat liberated or absorbed in any chemical transformation is independent of the manner in which the reaction takes place, provided the initial and final states are the same in every case. That is, the total heat of the reaction is the sum of the heats of the various intermediate steps. This is true only if all steps of the process are carried out either at constant volume or at constant pressure.

Heterocyclic—See *cyclic*.

Hexagonal System—One of the groups of crystalline form (including the *rhombohedral* division) in which three equal lateral angles intersect at angles of 60° and with a vertical axis of variable

length at right angles, as in the hexagonal prism.

Homocyclic—See *cyclic.*

Honeys—See *mellita.*

Hormone—A chemical secretion from a gland which by passage through the blood stream stimulates the activity of another organ.

Humidity—In hygrometry the *absolute humidity* is the amount of vapor actually present in the air and is expressed either in its expansive force, or in its weight per given volume. *Relative humidity* is the ratio of the quantity of vapor actually present to the greatest amount possible at the given temperature. Complete saturation of the air by a vapor is designated as humidity 100.

Hydragogue—See *diuretic, purgatives.*

Hydration, Heat of—The heat evolved or absorbed when hydration occurs. It is the difference between the heats of solution of the anhydrous and the hydrated forms. It is usually expressed in calories per gram molecule.

Hydrocarbon—A chemical compound containing only hydrogen and carbon.

Hydrogen Ion Concentration—The concentration of hydrogen ions in a solution in gram-ionic weights per liter. See *pH.*

Hydrometer—A floating instrument for determining specific gravities, especially of liquids and solutions. It is usually a hollow glass or metal instrument, weighted at one end so as to float upright. The stem of the instrument is graduated so as to indicate the gravity of the liquid. Many instruments, for use with specific solutions, have arbitrary scales and are usually known by the names of the inventors. See special section on *Hydrometers.*

Hygroscopic—Readily absorbing, becoming coated with, and retaining moisture but not enough to make a liquid. See *deliquescence.*

Hypnotics (Somnifacients; Soporifics)—Drugs which produce sleep leaving undisturbed the normal relationship of the mental faculties to the external world. In a broad sense these may be considered to include narcotics and anesthetics (chloral hydrate, sulfonal). See *cerebral depressants.*

Hypodermic—A subcutaneous (beneath the skin) injection.

Hypoglycemic—Indicating a low or reduced level of blood sugar.

Indicator—A substance, which by some visible change, such as a change of color, indicates the condition of a solution as to the presence of free acid, alkali, or other substance. Indicators are employed in volumetric (titrimetric) analysis to indicate the end points of reactions.

Infusa (Infusions)—Aqueous solutions of vegetable drugs prepared by adding boiling water to the drug in a closely-covered container and allowing to stand for half an hour, then straining and expressing. They are usually prepared in a 5% concentration.

Inorganic—Designating, or pertaining to, the branch of chemistry which deals with substances of earthy or mineral matter. It includes the treatment of all substances with the exception of those classed as *organic* (q.v.)

Intumescence—A swelling or bubbling caused by heat.

Iodine Number (value)—A number expressing the percentage (i.e., grams per 100 grams) of iodine absorbed by a substance. It is a measure of the proportion of unsaturated linkages present and is usually determined in the analysis of oils and fats.

DEFINITIONS OF TERMS

Ion—In electrolytic phenomenon, a particle bearing an electric charge which is formed when a neutral atom, or group of atoms, loses or gains one or more electrons. Loss of electrons results in positive charges producing a *cation*; gain of electrons results in the formation of an *anion* with negative charges. The valence of an ion is equal to the number of charges borne by it. In some crystals, such as NaCl, ions are supposed to form the units of the space lattice. Solution of such a crystal in an ionizing solvent such as water merely separates the ions. In other cases, ionization probably does not occur until the substance is dissolved in the solvent. Gaseous ions may be formed by the exposure of a gas to X rays, fast moving electrons, alpha or beta particles, etc.

Ionic Radius—See *atomic radius.*

Ionization Constant—The equilibrium constant for the reversible dissociation of a weak electrolyte. For example, if the weak acid *HA* dissociates into H^+ and A^-, then

$$K_i = \frac{(C_{H^+})\ (C_{A^-})}{(C_{HA})}$$

where K_i is the ionization constant if the concentrations of ions is expressed in gram-ionic weights per liter and the concentration of the unionized molecules, *HA*, is expressed in gram-moles per liter. See *equilibrium constant.*

Ionization, Heat of—The amount of heat evolved or absorbed when a definite amount of a solute ionizes. It is usually expressed in calories per gram molecule.

Ionization Theory—See *electrolytic dissociation theory.*

Irritants (Counter-irritants)—Substances which when applied to the skin cause vascular excitement. They are called *counter-irritants* if they are used to promote reflex action on remote parts. Irritants are usually classified as (*a*) rubifacients, (*b*) vesicants, (*c*) pustulants, and (*d*) escharotics. See these latter terms.

Isobar(e)—One of two atoms having practically identical atomic weights but different atomic numbers and, therefore, different chemical properties; e.g., calcium-40 (with 20 protons and 20 neutrons) and argon-40 (with 18 protons and 22 neutrons).

Isocyclic—See *cyclic.*

Isometric System—One of the groups of crystalline form in which the three axes of a crystal are at right angles, as in the cube, regular octahedron, etc.

Isotopes—Forms of an element that differ from one another in the mass of their atoms and in the properties dependent on that mass. Having the same atomic number and the same number of valence electrons, isotopes occupy the same position in the periodic table and have identical chemical properties. They are distinguishable only by the small differences in atomic weight or by radioactive transformations.

Izod—The units of impact strength as obtained on an Izod impact testing machine.

Juices—See *succi.*

K-electron—An electron from the innermost shell of a complicated atom.

Ketone—Any one of a class of compounds having two hydrogen atoms less than a secondary alcohol, and characterized by the carbonyl group (:CO) united to two hydrocarbon radicals.

Kinetic Energy—Energy, or the capacity for performing work, which a body or system possesses by virtue of its motion.

Kinetic Theory of Gases—The theory that all gases are made up of discrete spherical entities, molecules, which are in constant motion. It is assumed that the molecules move in straight lines with high average velocity, continually en-

countering one another, and hence changing their individual velocities and directions by perfectly elastic collisions. The distances between the molecules are large compared with their size. Temperature is due to the average kinetic energy of these molecules, while pressure is caused by the bombardment of the walls of the container by the molecules.

Konseals—See *cachets*.

Latent Heat of Vaporization (or of fusion)—See *heat of vaporization (or of fusion)*.

Lattice (or space-lattice)—The geometrical arrangement of the atoms in a crystal as disclosed by X ray analysis. It is the sum total of the points of intersection of any three sets of equidistant parallel planes.

Laxatives (Aperients)—Purgatives which excite moderate peristalsis giving soft movements without irritation (magnesia). See *purgatives*.

Le Chatelier-Braun Principle (or law)—When a system, which is in equilibrium, is subjected to a stress, the system tends to adjust itself in such a way as to partly relieve the stress. The stress may be an increase or decrease in temperature, in pressure, in the concentration of one of the reactants or one of the products, etc. For example, in the equilibrium: $2NH_3 \leftrightarrows N_2 + 3H_2$, if the pressure is increased the equilibrium will be shifted toward the left because two ammonia molecules occupy less space than three molecules of hydrogen plus one molecule of nitrogen; the shifting of the equilibrium in this direction will tend to counteract the pressure stress in this case.

Levo (rotatory)—A counterclockwise or left-handed turning motion usually applied to the turning of the plane of polarized light.

Lignin—A plant material which, in conjunction with cellulose, forms the cell walls and the cementing material between them in woods and many plants. It can be isolated by means of aqueous 72% sulfuric acid under properly controlled conditions of temperature and time.

Linimenta (Liniments)—Solutions or mixtures for external application usually by rubbing. They usually contain fixed or volatile oils.

Liquefaction—The act or process of transforming any substance into a liquid, especially the conversion of a solid into a liquid by heat, or of a gas into a liquid by cooling or pressure.

Liquefaction, Heat of—This is also called heat of fusion or of condensation. See *fusion, heat of*.

Liquid—A form of fluid which is characterized by free movement of the constituent molecules among themselves but (differing in this respect from gases) without the tendency to separate from one another. Liquids differ from solids in yielding easily to pressure and the ease with which their particles move upon one another, thus causing them to adopt themselves to the shape of the containing vessel. See also *fluid*.

Liquid Crystal—A liquid having certain physical properties characteristic of crystals, such as double refraction and interference colors. It is an anisotropic liquid.

Liquores (Liquors)—Aqueous solutions of non-volatile substances, usually inorganic compounds.

Lithotriptics—Drugs supposedly dissolving or causing the excretion of urinary and biliary concretions (urates: alkaline salts; calcium oxalate: acids, carbonated waters; phosphatic deposits: ammonium benzoate).

Loss of Head (or friction loss)—The pressure lost in a pipe line due to the velocity of the liquid in the pipe line, the

condition of the pipe wall, and the alignment of the pipe. It is usually expressed as loss of head in feet per thousand feet of pipe.

Lozenges—See *trochisci.*

Luminescence—Any emission of light occurring at low temperatures and not caused by incandescence. It may be produced in various ways, such as, by chemical action (chemiluminescence); by electric action (electroluminescence); by crystallization (crystalloluminescence); by friction (triboluminescence); by moderate and sudden heating of substances previously exposed to light or cathode rays (thermoluminescence); by exposure to light (photoluminescence; called *fluorescence* if observed during excitation, and *phosphorescence* if observed after excitation); by autoluminescence of radioactive substances (without exposure to light or external excitation).

Magmae—Suspensions of finely divided insoluble substances in water usually produced by chemical reaction. The suspensions are fairly stable and are often known as *milks.*

Magnetic—See *diamagnetic* and *paramagnetic.*

Malleable—Possessing the property of being shaped or extended by beating with a hammer or by pressure of rollers.

Mariotte's Law—See *Boyle's law.*

Mass Action, Law of—The law, established by Guldberg and Waage, that the rate of a chemical reaction is proportional at any instant to the active masses of the reacting substances. By "active mass" is meant the molecular concentration of the substance available for chemical reactions; i.e., the number of moles per unit volume. For dissolved substances the active mass may sometimes be expressed in terms of osmotic pressure, and with gases in terms of the partial pressures of the reactants.

Mass Number—The mass of the individual atoms of an isotope compared with the value of 16.0000 as the mass of the atom of the most abundant isotope of oxygen. It is the whole number nearest the isotopic weight.

Massae (Masses)—Pill masses preserved in bulk, to be used when required.

Maumene Number (value)—The maximum rise in temperature, expressed in degrees Centigrade, obtained by slowly introducing 10 cc of concentrated sulfuric acid into 50 g of oil.

Mechanical Equivalent of Heat—The amount of work which is equivalent to one calorie of heat. It is equal to 4.1855 ±0.0004 absolute joules per gram-calorie (15°).

Medicated Pencils—See *stili medicamentorum.*

Mellita (Honeys)—Mixtures of medicinal substances with clarified honey.

Melting Point—The normal melting point of a solid is the temperature at which the solid and the liquid phases of the material are in equilibrium, under a pressure of one atmosphere.

Metal—In a broad sense (including alloys, q.v.), a metal is any one of a class of substances which typically show metallic luster, are good conductors of heat and electricity, are opaque, are malleable and ductile, and may be fused. In a narrow sense, the term refers to metallic elements.

Metal Shrinkage (or pattern maker's allowance)—The allowance which must be taken into account in constructing a pattern because of the diminution in volume (shrinkage) which occurs when metal passes from the liquid to the solid form.

Metalloid—See *metal* and *nonmetal.*

DEFINITIONS OF TERMS

Methoxyl Number (value)—The amount of methoxyl, a chemical radical CH_3O, which occurs as a substituent group in some substances and which can be determined as methyl iodide by treating the substances with hydriodic acid.

Mho—See *conductance.*

Mineral—Any element or compound occurring naturally in the mineral kingdom as distinguished from occurrence in either the vegetable or animal kingdoms.

Mineral Oil—Any oil of mineral origin as distinguished from plant and animal oils. The mineral oils include such materials as petroleum, shale oil, or oils obtained from them by distillation. They are essentially mixtures of hydrocarbons.

Misturae (Mixtures)—Liquid preparations of insoluble, suspended, active substances, or solutions containing more than one liquid of medicinal activity.

Modulus (coefficient) of Elasticity—The modulus of elasticity is the ratio of the internal stress to the strain giving rise to it. For any special type of deformation it is a number characteristic of each substance. Special coefficients are used for deformations involving changes both in volume and in shape. Young's modulus is most often used and applies to the stretching of a wire or rod, or to the compression of a pillar; it is the ratio of F/A to l/L, where F is the increase in the force acting over the cross section whose area is A, corresponding to a change in length l of a wire or rod whose original length was L.

Molality—The strength of a solution expressed in gram moles of solute per 1000 grams of solvent; e.g., a solution containing 2 gram-moles of sodium chloride per 1000 grams of water is 2 molal.

Molarity—The strength of a solution expressed in gram moles of solute per liter of solution.

Mole (or mol)—The weight of a substance equal numerically to its molecular weight. A gram-mole is the weight in grams equal to the molecular weight; a pound-mole is the weight in pounds equal to the molecular weight.

Mole (or mol) Fraction—The quotient obtained by dividing the number of moles of any one substance in a system by the total number of moles of all substances in the system.

Molecular Depression (or lowering)—See *depression (molecular), coefficient of.*

Molecular Elevation—The increase of the boiling point in degrees Centigrade produced by the solution of one gram molecular weight of a substance in 1000 grams of a specified solvent.

Molecular Volume—The quotient obtained by dividing the molecular weight of a substance by its density in grams per cubic centimeter at the desired temperature is the molecular volume in cubic centimeters per gram-mole.

Molecular Weight—The sum of the atomic weights of all the constituent atoms in the molecule of an element or a compound.

Molecule—When atoms combine they form a molecule. In the case of an element or a compound, a molecule is the smallest unit which chemically still retains the properties of the substance

Monoclinic System—One of the groups of crystalline form in which there are three unequal axes, with one oblique intersection, as in the oblique rhombic prism.

DEFINITIONS OF TERMS

Motor Depressants (Depresso-motors)—Drugs which lower the functional activity of the motor apparatus and spinal cord (amyl nitrite, gelsemium).

Motor Excitants (Excito-motors; Spinants)—Drugs which increase the functional activity of the motor apparatus and spinal cord (nux-vomica, picrotoxin).

Mucilagines (Mucilages)—Saturated aqueous liquids, either adhesive or jelly-like, prepared from gums or starch.

Mydriatics—Drugs which dilate the pupil of the eye (atropine).

Myotics—Drugs which contract the pupil of the eye (pilocarpine).

Narcotics—Drugs which first excite and stimulate all body functions, then cause profound sleep, stupor, coma, insensibility and which may cause death by paralyzing the medulla centers governing respiration and other vital functions (opium, cannabis). See *cerebral depressants*.

Nebulae (Sprays)—Aqueous or oily (light liquid petrolatum) solutions to be used in an atomizer for nares and throat.

Neutralization, Heat of—The heat evolved in dilute solution by neutralization of a gram equivalent of an acid with a base at some specified temperature. For strong acids and bases, the heats of neutralization are nearly constant, the average being 13,800 gram calories per gram-mole at 20°C.

Neutron—An uncharged particle of about the same mass as a hydrogen atom (which is 1 on the chemist's scale) and about 1800 times heavier than the electron. Neutrons and protons make up the nucleus of the atom.

Non-carbonate Hardness—See *hardness*.

Nonmetal—An element which does not possess the properties of a metal (q.v.). Unlike the metals, the nonmetals form stable compounds with hydrogen and do not form basic oxides or hydroxides. Certain elements, such as arsenic and antimony, are classed as *metalloids* because they share certain properties of both the metals and the nonmetals.

Normal Solution—A solution of such a concentration that it contains one gram-equivalent of a substance per liter of solution.

Octane Number—This is a number which is a measure of the antiknock value, or better of the detonation characteristic, of a motor fuel. It represents the percentage by volume of "iso-octane" (2,2,4-trimethylpentane) in a mixture of iso-octane and normal heptane which gives the same amount of detonation as the fuel to be rated *when tested under the same conditions*. Cf. ASTM Standards of Petroleum Products and Lubricants, No. D-357-34T.

Ohm—The international ohm is the resistance offered at 0°C. by a column of mercury 106.300 centimeters in length, of constant cross-sectional area, and weighing 14.4521 grams. Such a column has a cross-sectional area of approximately one square millimeter.

Oil—Any one of a large class of substances which are liquid at room temperature, soluble in ether and in alcohol, insoluble in water, and usually lighter than water. They are classified in various ways; from their origin, as *mineral*, *vegetable*, and *animal*; according to their behavior when heated as *fatty* or *fixed*, and *essential* or *volatile*. The fixed oils are further subclassified as *drying*, *semi-drying*, and *non-drying*, according to the degree with which they absorb oxygen thus becoming hard and resinous when exposed in a thin film to the air. See also *fat*, and *wax*.

Ointments—See *unguenta*.

DEFINITIONS OF TERMS

Olea (Oils)—Fixed or volatile oils, the former obtained by expression and the latter by distillation.

Oleata (Oleates)—Solutions of medicinals in oleic acid, usually intended for external application.

Olefin—Any open-chain hydrocarbon containing one double bond. Olefins are members of the ethylene series and have the general formula C_nH_{2n}. Somewhat similar hydrocarbons, but having two, three, or more, double bonds, are called diolefins or dienes (C_nH_{2n-2}), triolefins or trienes (C_nH_{2n-4}), etc.

Oleoresin—See *essential oil.*

Oleoresinae (Oleoresins)—Natural solutions of resins in volatile oils, occurring as such in plants.

Optical Activity—Possessing the property of rotating the plane of polarized light. See *polarization.*

Organic—Designating, or pertaining to, the branch of chemistry which treats of the hydrocarbons and their derivatives (or, which is almost the same, the chemistry of the carbon compounds), whether of natural or of synthetic origin.

Orthobaric Density—The density of a liquid substance and the density of the vapor of the substance in equilibrium with the liquid at a given temperature and pressure. As the temperature rises, the density of the liquid decreases, while the density of the vapor increases, until they become equal at the critical temperature and critical pressure.

Orthobaric Volume—The reciprocal of the orthobaric density. See *orthobaric density.*

Orthorhombic System—One of the groups of crystalline form in which there are three unequal axes at right angles, as in the right rhombic prism.

Osmotic Pressure—The unbalanced pressure which gives rise to the phenomena of diffusion and of osmosis; as when a solution is separated from a pure solvent or from another solution of different concentration by a semipermeable membrane, molecules of the solvent will diffuse through the membrane from the more dilute to the more concentrated solution. The hydrostatic pressure required to stop this diffusion is the osmotic pressure. Closely related to gas pressure, it is proportional to the absolute temperature and also to the molecular concentration, and apparently it is equal to what the pressure of the dissolved substance would be if it were a gas at the same temperature and had a volume equal to that of the pure solvent.

Oxidation—In a broad sense oxidation is the increase in positive valence or decrease in negative valence of any element in a substance. On the basis of the electron theory, oxidation is a process in which an element loses electrons. In a narrow sense, oxidation means the chemical addition of oxygen to a substance.

Oxidation, Heat of—The heat evolved when a substance is oxidized. It is usually expressed in calories per gram-molecule.

Oxidizing Agent—A chemical reagent which causes oxidation of other substances and is thereby reduced. See *oxidation* and *reduction.*

Oxytocics—See *ecbolics.*

P (proton) Number—A term used, instead of isotopic weight, to designate the whole-numbered atomic weight or the number of hydrogen nuclei.

Packing Fraction—The packing fraction of any atomic species is equal to $(A - W)/W$, where A is the exact atomic weight of the species and W is the integer nearest to A. Values 10,000 times larger than the values given in the preceding definition are also called the packing fraction and commonly employed.

DEFINITIONS OF TERMS

Parachor—A constant dependent on the constitution of a compound and related to its molecular volume. Being an additive property, it finds application in organic chemistry for checking structure of compounds. The parachor (P) is equal to $(M \times \gamma^{\frac{1}{4}})/(D - d)$, where M is the molecular weight, γ the surface tension, D the density of the liquid, and d the density of the vapor at the same temperature.

Paramagnetic—Possessing, or pertaining to, the magnetic properties of bodies whose permeability is greater than unity (i.e., greater than that of a vacuum). Paramagnetic substances are attracted by a magnet if the surrounding medium is air. See *diamagnetic*.

Parasiticides (Germicides)—Substances which kill animal and vegetable parasites (mercuric chloride, phenol).

Partial Pressure, Law of—See *Dalton's law*.

Partition Coefficient—See *distribution law*.

Pastilles—See *trochisci*.

Pearl—A term used in pharmacy for a glass capsule containing some volatile liquid for inhalation, as amyl nitrite. For use, the capsule is crushed in a handkerchief and the vapors inhaled therefrom.

Pencils—See *bougies*.

Pentosan—Any one of a group of anhydropentose residues which generally occur as polysaccharides in plant materials and which can be hydrolyzed by acid to pentose sugars.

Perfect Gas—A perfect or ideal gas is one which fulfills two conditions: (1) the equation $PV = nRT$ is obeyed exactly when the temperature T, the pressure P, and the volume V are varied (n is the number of moles of gas, and R is the gas constant, q.v.); and, (2) its internal energy E is a function of the temperature alone, and does not change with a change in volume of the gas at a constant temperature.

Periodic Law—The law that the chemical and physical properties of the elements are periodic functions of their atomic numbers. By periodic function is meant that the properties repeat at certain intervals. See *periodic table*.

Periodic Table—A table in which the elements are arranged in order of increasing atomic number. Elements of similar properties are placed one under the other, yielding families or groups of elements of which there are eight. Within each group there is a gradation of chemical and physical properties, but in general a similarity of chemical behavior. From group to group, however, there is a progressive shift of chemical behavior from one end of the table to the other.

pH—*The exact significance of pH is still in dispute* (cf. *J. Am. Chem. Soc.* 60, *1094* (*1938*)). It is commonly considered to be the negative logarithm (to the base 10) of the hydrogen ion concentration of a solution. Others interpret it as the negative logarithm of the "activity" of the hydrogen ions in a solution. Exactly, neither is correct but the experimental determination of pH continues to offer valuable information as to the immediate acidity, as contrasted to the total acidity, (which may be titrated), of a solution. The experimental meaning of pH is given by the following equation: pH = (emf of H_2-calomel cell − emf of calomel half-cell at temp. T)/0.0001983222T.

Phenol—Any one of a series of aromatic hydroxyl derivatives which has the OH group directly attached to the ring and of which phenol (carbolic acid) is the type. Specifically the term phenol is applied to carbolic acid, C_6H_5OH.

Phenol Coefficient—The ratio of the dilution of a disinfectant required to kill the Hopkins strain of typhoid bacillus under carefully controlled conditions in a

specified time compared with the dilution of phenol required for the same organism under the same conditions. Usually 2.5 and 15 minute time limits are used and the coefficient is calculated from the average of these two. For example, if 1:80 and 1:110 dilutions of phenol kill in 2.5 and 15 minutes, respectively, and the corresponding dilutions of a disinfectant under test are 1:375 and 1:650, then the phenol coefficient of the disinfectant is $\frac{1}{2}[(375/80) + (650/110)]$ or 5.30.

Photochemistry—The branch of chemistry concerned with the effect of radiant energy, especially light, in causing chemical changes. *First law (Grotthuss-Draper law)*—Only that light which is absorbed can act chemically. *Bunsen-Roscoe law*—The amount of material transformed in a photochemical change is proportional to the product of the light intensity and the time of illumination. *Second law (Einstein photochemical equivalence law)*—Each absorbed quantum should cause one light-absorbing molecule to react. *First law of fluorescence (Stoke's emission law)*—The energy emitted as light during fluorescence is less than the energy absorbed as light for excitation; i.e., the absorbed wave lengths are shorter than the emitted wave lengths. *Second law of fluorescence (luminescence equivalence law)*—The absorption of radiation by a luminescent system is a quantum process involving one quantum per absorbing particle (e.g., atom or "center"), the yield being unity in the ideal case.

Photoluminescence—See *luminescence.*

Photon—An amount of radiant energy equal to the quantum, having a momentum equal to the energy divided by the velocity of light, occupying a small volume, and moving as a whole in one direction with the velocity of light.

Pilulae (Pills)—Solid bodies, usually spherical or oval, containing medicinal substances, and intended to be swallowed whole. They may be uncoated or coated with various substances (gelatin, sucrose, cacao, tolu, etc.) to mask unpleasant taste. If it is desired that the pill pass unchanged through the stomach and be dissolved in the intestine, it is coated with keratin or salol. Such a coating is known as an *enteric* coating.

Pitot Tube—A device used to measure the velocity of fluid flow. It consists of a tube with a short right-angled bend, placed vertically in the moving body of fluid with the bent part lowermost and its opening normal to the direction of flow.

Planck's Constant—The term h in the fundamental equation of the quantum theory: $\Delta E = h\nu$, where ΔE is the difference in energy of an electron in two different orbits of an atom, ν the frequency of the radiation emitted by the atom when the electron jumps from one orbit to the other in which its energy is less, and h a universal constant with dimensions the same as those of action. It is equal to $(6.624 \pm 0.002) \times 10^{-27}$ erg-seconds.

Plasters—See *emplastra.*

Plastic—A substance capable of, or the property of, being deformed continuously and permanently in any direction without rupture, under a stress greater than the yield value.

Polar—Designating, or characterized by, a union of atoms in which the bonds are electrostatic attractions between oppositely charged particles (ions). Thus, in potassium chloride (KCl), the potassium atom has lost an electron to the chlorine thereby becoming positively charged (K^+), while the chlorine has thereby become negatively charged (Cl^-). The term polar is used also to designate molecules which possess a permanent *electric moment,* or *dipole moment,* μ.

Polarization (of light)—The act or process of affecting light in such a manner that the vibrations assume a definite form. In nonpolarized light the

vibrations are in all directions perpendicular to the ray, whereas in polarized light the paths of the vibrations (all in a plane perpendicular to the ray) may be straight lines, *plane polarized*; or circles, *circularly polarized*; or ellipses, *elliptically polarized.*

Potential Difference (between two points)—This is the quotient obtained when the work done in transporting any quantity of electricity from one of the points to the other is divided by that quantity of electricity. It is commonly measured in volts and often abbreviated *p. d.*

Potential Energy—Energy which a system possesses by virtue of its position or configuration.

Potentiometer—An apparatus for the dividing of a given potential into any fractional part. An instrument for measuring or comparing electromotive forces, in which the impressed potential is opposed by a known potential until there is no current flow.

Poultices—See *cataplasmata.*

Primary Standard—A term in analytical chemistry designating a substance of constant composition and of sufficient purity to be used for standardizing volumetric (titrimetric) solutions, or which may be used for the preparation of volumetric (titrimetric) solutions, and when made up to an exact volume the solution requires no further standardization.

Progestational—Favoring female characteristics, especially the receptivity to pregnancy; the progestational state is a component of the normal female endocrinological cycle.

Proliferation—Growth on the cell level.

Proof Spirit—In the United States proof spirit is an alcoholic liquor of specific gravity $0.93426\frac{4}{10}$° F. Such a solution contains one-half its volume of an alcohol with the specific gravity 0.7939^{50}° F. which represents 42.49% of absolute alcohol by weight, or 50 parts of alcohol to 53.71 parts of water by volume, the apparent excess of water being due to a contraction in volume on mixing the alcohol with the water. Liquors containing less alcohol than proof spirit are termed *under proof*; thus, 10% or 10° under proof is a spirit which at 60°F. contains 90 volumes of proof spirit and 10 of water. Similarly a 25° *overproof* (or *above proof*) indicates a spirit of such a concentration that 100 volumes at 60°F. must be diluted with water to 125 volumes to obtain proof spirit. Although the laws in the United States are worded in terms of proof spirit, it is more customary to express the concentration of alcohol in % by volume.

Prophylactics—Substances administered to prevent disease (diphtheria antitoxin).

Protectives—Substances used as mechanical coverings to protect various injured parts from air, water, and friction (collodion).

Protein—Any one of a class of naturally occurring compounds containing carbon, hydrogen, oxygen, nitrogen, often sulfur, phosphorus, occasionally iron and a few other elements. They are essentially very complex combinations of amino acids and are constituents of all living cells both animal and vegetable. They combine with both acids and bases, and are usually amorphous and colloidal. Since most proteins contain about 16% nitrogen, it is customary in analytical chemistry to multiply the total nitrogen by the factor 6.25 in computing the per cent of protein in a sample. Proteins are an essential constituent of the diet of the animal organism.

Proton—A positively charged particle of about the same mass as a hydrogen atom (which is 1 on the chemist's scale) and about 1800 times heavier than the electron. The electrical charge of the proton is equal and opposite to the charge of the

DEFINITIONS OF TERMS

electron. Protons and neutrons (q.v.) make up the nucleus of the atom.

Proton Number—See *P number*.

Pulmonary Sedatives—Drugs which lessen the irritability of the respiratory nerves or center, thereby diminishing cough and dyspnea. They may depress the center, remove irritating substances from the passages, lessen local congestion, or lower excitability of the vagus end-organs and afferent filaments of the respiratory tract (morphine, codeine, hydrogen cyanide).

Pulveres (Powders)—Finely powdered drugs or mixtures of the same, frequently consisting in part of some suitable diluent.

Purgatives (Cathartics)—Drugs which increase or hasten intestinal evacuations. They are usually classified as follows: (*a*) *laxatives*; (*b*) *simple purgatives*, which cause active peristalsis and stimulate secretion of the intestinal glands, giving one or more copious, semifluid movements accompanied by some irritation and griping (aloe, castor oil); (*c*) *saline purgatives*, which stimulate intestinal glands, increase peristalsis and osmosis, causing watery stools (magnesium sulfate); (*d*) *drastic purgatives*, which cause violent peristalsis, watery stools, griping and irritation (jalap, colocynth); (*e*) *hydragogue cathartics*, which remove much water from the vessels causing watery stools (croton oil, elaterinum); (*f*) *cholagogue purgatives*, which stimulate the flow of bile causing free purgation of green colored (bilious), liquid stools (aloe, mercurials).

Pustulants—Drugs which cause blisters. See *irritants*.

Quantum—The "bundle" of radiant energy which, according to the quantum theory, is emitted as a unit by a "resonator" vibrating with a frequency ν. The energy of such a bundle (i.e., of a quantum) is equal to $h\nu$, where h is Planck's constant (q.v.).

Radical—A group of atoms remaining unchanged during a series of reactions and which may be regarded as playing the part of a single atom. See special *table of radicals*.

Radioactive Constant—The constant λ in the equation for the rate of change of radioactive material: $E = E_o e^{-\lambda t}$, in which E_o is the initial quantity of radioactive material undergoing change, E the quantity remaining unchanged after the lapse of any interval of time t, e the base of the Naperian logarithmic system, and λ the radioactive (decay) constant, by which is meant the fraction of the total which changes in unit of time.

Radioactivity—The property possessed by certain elements and their compounds of spontaneously emitting radiation by the disintegration of the nuclei of the atoms. The radiation consists of alpha, beta, or gamma rays, neutrons, protons, deuterons, and nuclei of hydrogen-3. Alpha rays are emitted when an atom loses a helium nucleus and thereby changes to an atom with an atomic number two units lower. Beta rays are the result of the loss of an electron from the nucleus whereby an atom is formed with an atomic number one unit higher. These changes are sometimes accompanied by the emission of gamma rays which are vibrations of high frequency. A series of such changes (disintegration series) continues until a stable product is formed.

Raman Effect—The changing of the wave length of some of the scattered rays when a beam of light is passed through a pure liquid or vapor. It is useful in the determination of constitution.

Raoult's Law—The lowering of the vapor pressure of a solvent due to the presence of dissolved solute, divided by the vapor pressure of the pure solvent, is equal to the mole fraction of the solute. The law may be used for the calculation of the vapor pressure of solutions containing non-volatile solutes, or the partial pressure of the solvent if the solute is

volatile. This law plays the same role with solutions as do the perfect gas laws in the case of gases; i.e., it expresses the conditions which exist in an ideal solution. It does not hold for electrolytes because of dissociation.

Rare Earth—Any one of a series of very similar oxides of metals with consecutive atomic numbers from 57 through 71 (with the exception of cerium, No. 58, which is sometimes considered not to be a member of the series) and a characteristic valence of three. They occur in widely distributed but relatively scarce minerals.

Rayon—A generic name of filaments made from various solutions of modified cellulose by pressing or drawing the cellulose through an orifice and solidifying it in the form of a filament or filaments by means of some precipitating medium; also a fabric woven from such filaments.

Reacting Weight—See *equivalent weight.*

Reaction, Heat of—The heat evolved or absorbed during a chemical reaction in which the final state of the system is brought to the same temperature as that of the initial state. The numerical values for heats of reaction usually accompany a chemical equation expressing the reaction and are for the number of gram-moles (usually) involved in the equation as written.

Reaction (or van't Hoff) Isochore—The equation which represents the variation of the equilibrium constant with temperature: $d \ln K_c / dT = Q/RT^2$, where $\ln K_c$ is the logarithm to the base e of the equilibrium constant obtained when the "active masses" of the products and reactants are measured in moles per liter at the absolute temperature T; R is the gas constant expressed in calories per degree per mole (1.987); and Q is the heat of the reaction at constant volume expressed in calories.

Reducing Agent—A chemical reagent which brings about the reduction of some other substance and is itself simultaneously oxidized. See *reduction* and *oxidation.*

Reduction—In a narrow sense reduction means the decrease in the oxygen content, or the increase in the hydrogen content, of a substance. In a broad sense, reduction is the decrease in positive valence or the increase in negative valence of an element. See also *oxidation.*

Reflection, Law of—The law that light, falling upon a plane surface, is so reflected that the angle of incidence is equal to the angle of reflection, and that the incident ray, the reflected ray, and the normal all lie in the same plane.

Refraction—The deflection from a straight path suffered by a ray of light in passing obliquely from one medium into another in which its velocity is changed. See also *refraction, index of.*

Refraction, Index of—A constant, characteristic of each substance, which represents the ratio of the velocity of light in a vacuum to that in the substance. It is the ratio of the sine of the angle of incidence to the sine of the angle of refraction when light passes obliquely into a medium. It varies with the temperature, pressure, wave length of light, and with the media. *Absolute index* is the ratio of the velocity of light in a vacuum to that in a given medium. Since the index of refraction of air is so near unity, it is commonly used as a more convenient standard than a vacuum. *Relative Index* is the ratio of the velocity of light in two different media. See also special section *index of refraction.*

Refractive Index—See *refraction, index of.*

Refrigerants—Drugs which allay thirst, giving the sensation of coolness (diluted vegetable and mineral acids).

Reichert-Meissl Number—The number of milliliters of decinormal alkali

required for neutralization of the volatile water-soluble fatty acids obtained from 5.5 grams of a fat or oil by a certain method of saponification and distillation. The number is a measure of the amount of low molecular weight fatty acids present in the sample.

Resin—A solid or semi-solid, amorphous (noncrystalline) organic substance which often softens and melts but not at any definite temperature. The natural resins are chiefly of plant origin, usually yellowish to brown in color, soluble in alcohol, ether, etc., but not in water. They are chiefly excretion products and exude from plants alone or as mixtures with essential oils, with gums, etc. Some are found as fossils after decay of the plant. The term is also applied to synthetic products of various types of chemical combinations which possess many of the same properties as the natural resins. They are all nonconductors or electricity and many are transparent or translucent.

Resistivity—The electrical resistance offered to the passage of a steady current. The specific resistance of a material is numerically equal to the resistance of a cylinder one centimeter in length and one square centimeter in cross-section.

Resolvents—See *alteratives*.

Respiratory Sedatives (Depressants)—Drugs which lower the activity of the respiratory center resulting in shallow and slow respirations (aconite, physostigma).

Respiratory Stimulants — Drugs which stimulate the respiratory center resulting in deeper and quicker breathing (strychnine, digitalis).

Restoratives—Substances which give strength and vitality. Restoratives are classified into (*a*) foods, (*b*) digestive ferments, (*c*) digestive acids, (*d*) fats, (*e*) hematinics, and (*f*) tonics. See these latter terms.

Rhombohedral System—A division of the hexagonal system (q.v.) in which the form is referred to three equal oblique axes parallel to the faces of the fundamental rhombohedron.

Roentgen Ray—See *X ray*.

Rubefacients—Substances which produce temporary redness and skin congestion. If left too long the action may become vesicant or even escharotic (mustard).

Salt—Any one of a class of similar compounds formed when the acid hydrogen of an acid is partly or wholly replaced by a metal or a metallic radical. They are formed by the action of acids on metals (with the elimination of hydrogen), and on oxides and hydroxides (with the elimination of water), by the direct action of an acid with ammonia or an ammonia derivative, and in other ways. Specifically, the term salt is applied to sodium chloride, NaCl.

Saponification—Process, act, or result of hydrolysis of an ester by an inorganic base, the product being a salt and an alcohol. When the ester being saponified is an animal or vegetable fat, the products are soap and glycerol. By extension, the hydrolysis of compounds other than esters.

Saponification Number—In the analysis of fats, oils, etc., the number of milligrams of potassium hydroxide required for the complete saponification of one gram of substance.

Saturated Solution—A solution which contains at any constant temperature as much dissolved substance as it can possibly hold in presence of solid solute.

Sectile—A mineralogical term applied to minerals which are capable of being severed by the knife with a smooth cut but yet pulverizable, as distinguished from brittle or malleable.

DEFINITIONS OF TERMS

Sedatives—In general, drugs which allay nervous irritation and irritability. Synonymous with cerebral depressants. See *pulmonary sedatives.*

Semi-alteratives (Alkalics)—Drugs which stimulate acid secretions and check alkaline secretions (carbonates).

Shrinkage—See *metal shrinkage.*

Sialagogues—Substances which promote the secretion and flow of saliva and buccal mucous (capsicum, physostigma).

Single Electrode Potential—See *electrode potential.*

Soap—The sodium or potassium salt of a higher molecular weight fatty acid; by extension, any salt of the fatty acids and commonly called a *metallic soap* when containing some metal other than sodium or potassium.

Solid—A part of space bounded on all sides and which does not perceptibly flow. Between typical solids and liquids are many gradations designated by terms such as *viscous solid, semi-solid, viscous liquid,* etc.

Solidification Point—The temperature at which a liquid changes into a solid. It may be identical with, or lower than, the melting point.

Solubility—The quantity of solute present in a given amount of the saturated solution, at a certain temperature, is called the solubility of the solute. It is expressed in any of the units used to express concentration of solution, such as grams of solute per 100 milliliters of solvent, grams solute per 100 grams of solution, moles of solute per liter of solution or per 1000 grams of solvent, etc.

Solubility Product—The maximum product of the ionic concentrations of a difficultly soluble salt which can exist in equilibrium with the solid phase at a definite temperature, each concentration being raised to its proper power. In general, if $A \rightleftarrows bB \times cC$ represents the equilibrium between the molecule A and its ions B and C in a saturated solution, then the solubility product K_{sp} is given by the equation: $K_{sp} = [B]^b \times [C]^c$, where $[B]$ and $[C]$ are expressed in gram-ionic weights per liter.

Solute—When a solid is dissolved in a liquid, the solid is termed the *solute,* the liquid the *solvent.* When one liquid is dissolved in a second liquid, the liquid present in the smaller amount is usually called the solute. In this case, the designation is arbitrary, particularly when the liquids are completely miscible.

Solution—A homogeneous mixture formed by the process in which a substance, whether solid, liquid, or gaseous, is mixed with a liquid (or by extension, with a solid, or gas) called the solvent. The term is usually associated with liquids but may include solids, as in alloys, or gaseous mixtures.

Solution, Heat of—The heat evolved or absorbed when a substance (solute) dissolves in a solvent. The *integral heat of solution* is the heat absorbed when one mole of solute is dissolved in a sufficient quantity of solvent to produce the specified concentration. Most values of heats of solutions are integral heats of solution of the solute in a large amount or specified amount of solution. The *differential heat of solution* is the amount of heat absorbed when one mole of solute is dissolved in such a large volume of solution of definite concentration that the concentration of the solution is not apparently altered. The differential heat of solution is the rate of change of the integral heat of solution per mole of solute at any specified concentration.

Solvent—See *solute.*

Somnificants—See *hypnotics.*

Soporifics—See *hypnotics.*

DEFINITIONS OF TERMS

Species (Teas)—Mixtures of cut or bruised vegetable drugs from which teas can be made.

Specific Gravity—The ratio of the weight of any volume to the weight of an equal volume of some other substance taken as the standard at stated temperatures. For solids or liquids the standard is usually water, and for gases the standard is air or hydrogen.

Specific Heat—The amount of heat required to raise a unit weight of substance one degree of temperature at either constant pressure or constant volume. It is usually expressed in calories per gram per degree Centigrade. See *heat capacity* for distinction between mean and true specific heats.

Spectrum—A series of radiant energies arranged in order of wave length; as for example, when a beam of light is subjected to dispersion and then brought to a focus to form a series of images arranged in order of their wave lengths.

Spinants—See *motor excitants.*

Spiriti (Spirits)—Solutions of volatile substances in alcohol or diluted alcohol.

Sprays—See *nebulae.*

Standard Solution—A solution, of accurately known or standard concentration, used as a reagent.

Sternutatories—Drugs which cause sneezing. When used to increase nasal secretion by applying to the mucous membrane of the nose they are usually referred to as *errhines* (ipecac, cubeb).

Stili Medicamentorum (Medicated Pencils)—Medicinal agents made into a plastic mass and rolled into cylinders for external application.

Styptics—See *hemostatics.*

Sublimation—The process of passing from the solid to the gaseous state directly. There is a definite vapor or sublimation pressure for a solid at each temperature. At this pressure and temperature the gaseous and solid phases are in equilibrium. If the temperature is kept constant and the outside pressure on the system is lowered, the solid will sublime. Substances like camphor, which sublime at atmospheric pressure, have a sublimation pressure at that temperature which is greater than the atmospheric pressure.

Sublimation, Heat of—The heat evolved or absorbed in subliming a unit mass at a specified temperature.

Succi (Juices)—Expressed vegetable juices usually preserved by the addition of alcohol.

Sudorifics—See *diaphoretics.*

Supersaturated Solution—A solution which contains more dissolved substance than it can normally hold at the same temperature in the presence of undissolved solute.

Suppositoria (Suppositories)—Solids of various shapes: cone-shaped, pencil-shaped, globular, or oviform, which contain medicines and which melt when inserted into the rectum, nares, urethra, or vagina. They are usually made from oil of theobroma, glycerinated gelatin, or sodium stearate.

Surface Tension—The property, due to molecular forces, existing in the surface film of all liquids which tends to contract the volume into a form with the least surface area. The particles in the surface film are inwardly attracted thus resulting in tension.

Symbol—An arbitrary or conventional sign, such as a character, a letter, abbreviation, etc., used instead of a word or words, as in chemistry, mathematics, etc., to represent elements, operations, etc.

DEFINITIONS OF TERMS

Syrupi (Syrups)—Concentrated aqueous solutions of sucrose containing either medicinal agents or flavoring agents.

Tabellae (Tablets)—Solid disk-like lenticular bodies made by compression. *Tablet triturates* are prepared by triturating drugs and then molding; lactose is usually employed as the diluent. See also *trochisci* and *toxitabellae.*

Taenifuges—See *anthelmintics.*

Teas—See *species.*

Tensile Strength—The greatest longitudinal stress a substance can withstand without rupture. It is usually expressed with reference to a unit cross-sectional area, as kilograms per square centimeter, or pounds per square inch, necessary to produce rupture.

Tetragonal System—One of the groups of crystalline form in which three axes are at right angles, but only two, the lateral axes, equal, as in the right square prism.

Thermal Conductivity—The quantity of heat passing in unit time through a plate of unit area and unit thickness, with a temperature differential of one degree between the faces of the plate. See special section on *heat conductivity.*

Thermal Expansion—See *expansion, coefficient of.*

Thermochemical Equation—An equation which, besides the stoichiometric chemical relationships, indicates also the energy change involved in a reaction.

Thermochemistry—That branch of chemical science concerned with the relations existing between chemical action and heat (thermal changes) which accompany chemical reactions.

Thermo (electric) Couple—Two bars or wires of dissimilar metals joined at one extremity and which develop a current (thermoelectric current) when heated.

Thermodynamics, Laws of—The laws of thermodynamics expressing certain energy relationships which were found to be true empirically. *First law*—This law, known also as the law of the conservation of energy, states that energy can be neither created nor destroyed; when one form of energy disappears another form always appears in equivalent quantity. *Second law*—This law states that heat cannot pass spontaneously from a colder to a warmer body; when free interchange of heat takes place, it is always the hotter of two bodies which loses energy and the colder that gains energy. *Third law*—This law states that every substance has a finite positive entropy, but at absolute zero the entropy may become zero, and is zero in the case of perfect crystalline substances.

Thermoluminescence—See *luminescence.*

Thermoneutrality, Law of—The law that no thermal effect is produced when dilute solutions of neutral salts are mixed and no precipitation occurs.

Tincturae (Tinctures)—Alcoholic solutions of drugs, prepared either by maceration, percolation, or solution. The alcoholic strength is variable and the drugs generally used are non volatile. The drug strength, where the drug is potent, is usually 10%. Where the drug is not very potent the strength is usually 20%.

Titer—The titer, as applied to solutions, is the concentration of a dissolved substance as determined by titration. The term is also applied to the minimum amount or volume required to bring about a given result in titration. The titer, as applied to fats, is the solidification point of the fatty acids liberated from a fat by hydrolysis.

DEFINITIONS OF TERMS

Titration—A method, or the process, of using a standard solution for the determination of the amount of some substance in another solution. The known solution is usually added in a definite quantity to the unknown until equivalent quantities have been added. If the reaction in question is in itself invisible, an indicator, having a visible reaction, correlated with the invisible, is used. From the quantity of known substance added and the reaction involved the quantity of unknown substance may be calculated.

Titrimetric—A word synonymous with volumetric when used with reference to chemical titration.

Tonics—Drugs which improve the tone of specific tissues by stimulating vital functions (mineral: phosphates; vegetable: gentian). See *restoratives.*

Toxitabellae (Poison Tablets)—These are tablets of angular shape (not discoid) each having the word "poison" and the skull and cross bones distinctly stamped upon it. The purpose of the distinctive shape and marking is to diminish poisoning by their accidental ingestion. The common one is corrosive sublimate.

Transference Number—In electrolysis, a number denoting the fraction of the total current passed through a solution of an electrolyte which any one ion carries. If n is the transference number of the anion, then $1 - n$ is that of the cation.

Transition Point (or temperature)—The temperature at which two crystalline forms of a substance are in equilibrium with each other. The transition temperature changes with the pressure on the system.

Triboluminescence—See *luminescence.*

Triclinic System—One of the groups of crystalline form in which there are three unequal axes and intersections oblique, as in the oblique rhomboidal prism.

Trochisci (Troches)—Solid, round, oval, or flat masses composed of medicinal agents combined with sugar or extract of licorice, massed with mucilage of tragacanth, flavored, and dried. They are also called *lozenges.* In England they are called *tablets* and are of a definite weight and have a chocolate base; *pastilles* (in England) have a glyco-gelatin base.

Ultimate Strength—The maximum force or load per square inch for a substance under tension.

Unguenta (Ointments)—These are soft or solid fatty preparations for external use, liquifying when applied to the skin and containing medicaments in a base of benzoinated lard, petrolatum, wool fat, prepared suet, expressed oil of almond, wax, spermaceti, paraffin, etc. They are also called *salves.*

Unsaponifiable—That portion of a fat or oil which does not react with alkali in the hydrolysis to form glycerol and fatty acid soaps.

Valence—The degree of combining power of an element or a radical. It is usually expressed by a number based upon hydrogen equal to unity. Thus when H = 1, then Na = 1, Mg = 2, PO_4 = 3.

Van't Hoff Isochore—See *reaction isochore.*

Van't Hoff's Law—The law that, when a system is in equilibrium, of the two opposed interactions the endothermic is promoted by raising the temperature, the exothermic by lowering it. It is a particular case of Le Chatelier's law (q.v.).

Vapor Density—The weight of a vapor per unit volume at any stated temperature and pressure.

Vapor Pressure—The pressure exerted by a vapor when a state of equilibrium has been reached between a liquid, solid,

or solution, respectively, and its vapor, is called the vapor pressure of a liquid, solid, or solution. When the vapor pressure of a liquid exceeds that of the confining atmosphere the liquid commonly is said to be boiling. See *boiling point.*

Vaporization, Heat of—The quantity of heat required to convert a unit quantity of liquid at a definite temperature to vapor at the same temperature. It is usually expressed in calories per gram, or calories per gram-mole.

Vegetable Oil—Any oil from plant origin as distinguished from animal (origin) oil. Usually the volatile (essential) oils are not included in this classification which is primarily intended to designate the fixed oils (i.e., glyceryl esters of various fatty acids). See *oil* and *animal oil.*

Vermicides—See *anthelmintics.*

Vermifuges—See *anthelmintics.*

Vesicants (Epispastics)—Substances which produce much inflammation of the skin with the effusion of serum between the epidermis and the derma (cantharides, volatile oil of mustard). See *irritants.*

Vina (Wines)—Liquids differing from tinctures in that the drug is extracted with white wine. The alcoholic content varies between 7 and 12%.

Vinegars—See *aceta.*

Viscosity—The resistance offered by a fluid (liquid or gas) to flow. The viscosity is a characteristic property and is a measure of the combined effects of adhesion and cohesion.

Vitamin—Any one of a group of constituents of most foods in their natural state and of which very small amounts are essential for normal nutrition. See special section on *vitamins.*

Volatile Acid—In analytical chemistry, any one of those acids which can be distilled from an aqueous solution at atmospheric pressure, such as acetic, butyric, etc., in contradistinction to the fixed acids, such as tartaric, phosphoric, etc.

Volatile Matter (in coal)—The percentage of the sample which consists of combustible material which is volatile, in the absence of air, at 950° ± 20°C.

Volatile Oil—An oil which is appreciably volatile. See *essential oil.*

Volt—The unit of electromotive force. It is the difference in potential required to make a current of one ampere flow through a resistance of one ohm.

Volumetric—A measurement of, or by, volumes as with standard solutions in titrimetric analysis or with the eudiometer in gas analysis.

Volumetric Factor—See *factor.*

Wafers—See *cachets.*

Watt—A unit of power. The power, P, in watts developed by an electric current of I amperes flowing under a potential drop of E volts is: $P = EI$.

Wax—Any one of a class of substances of plant or animal origin, insoluble in water, partly soluble in alcohol, ether, etc., and miscible in all proportions with oils and fats. They consist of esters and often, in addition, free fatty acids, free alcohols, and higher hydrocarbons. Usually, *true waxes* are distinguished chemically from fats (which are esters of glycerol) as consisting chiefly of esters of higher monohydroxy alcohols. Sometimes the distinction between waxes and fats is based only on physical properties, the waxes being less greasy, more brittle and harder than fats. The *mineral waxes* are substances of similar properties but of mineral origin and consist mostly of higher hydrocarbons.

DEFINITIONS OF TERMS

Weir—A device for determining fluid flow by measurements of the depth of fluid over the crest of sill and known dimensions of the device.

Wines—See *vina*.

X ray—Any of the radiations, similar to light radiation but of much shorter wave length, which are emitted by suddenly changing the velocity of a moving electric charge by impact of a cathode ray on a target in a vacuum tube and by the changes in the atoms of the target caused by the impact. These rays possess the peculiar properties of ionizing a gas through which they pass, of penetrating various solids, of affecting photographic plates, and of causing certain substances to fluoresce. They are also known as *roentgen rays*.

Yield Strength—The stress at which a material exhibits a specified limiting permanent set.

MEDICAL PRESCRIPTION NOTATION

1 drachm	... ʒ i, or ℥ j.	4 grain	... gr. iv.
1½ "	... ʒ iss.	8 "	... gr. viii. or gr. viij.
2 "	... ʒ ii, or ℥ ij.	½ ounce	... ℥ ss.
3 "	... ʒ iii, or ℥ iij.	1 "	... ℥ i, or ℥ j.
3½ "	... ʒ iiss.	1½ "	... ℥ iss.
1 gallon	... Ci or Cj.	½ pint	... Oss.
½ grain	... gr. ss.	1 "	... Oi or Oj.
1 "	... gr. i, or gr. j.	½ scruple	... ℈ ss.
1½ "	... gr. iss.	1 "	... ℈ i. or ℈ j.
2 "	... gr. ii, or gr. ij.	1½ "	... ℈ iss.
2½ "	... gr. iiss.	2 "	... ℈ ii, or ℈ ij.

℞ (L. *recipe*, take)—A symbol placed at the beginning of a prescription. It is supposed to have been originally ♃, the symbol of Jupiter, serving as an invocation to this king of the gods that the compound might act beneficially.

PHYSIOLOGICAL RESPONSE TO VARIOUS CONCENTRATIONS OF SOME COMMON GASES AND VAPORS

PHENOL COEFFICIENTS

Phenol coefficient determinations as usually performed do not always give a true indication of the value of a germicide in actual use. Organisms dried on various surfaces should also be exposed to the action of the germicide in order to test practical effectiveness and Shippen[7] subcultures should be made. Many antiseptics inhibit growth rather than kill. This is well known in the case of mercurials.[6]

PHOTOGRAPHIC FORMULAS

The purest water, preferably distilled, should be used for making all photographic solutions. Dissolve all chemicals in the order given. Do not add the next chemical until the last is completely dissolved. Use judgment in the warming of solutions during the dissolving of chemicals. Slightly warm water will produce prompt dissolving, but too much heat may cause reactions to occur which will destroy the value of the solution.

Throughout this table all references to sodium sulfite and sodium carbonate indicate the desiccated or anhydrous salt. If monohydrated or crystalline salt is used, increase the amount by 17 per cent for the monohydrated salt or double the amount for the crystalline form. In some formulas a proprietary alkali known as "Kodalk" is used. These formulas are designated by the letters "DK" before the formula number.

In most cases the manufacturer now encloses with each package of film, plates or paper a group of formulas which have been tested and found to give the best results for that particular product. Whenever such information is available, the user should not hesitate to take advantage of it, as it is to the manufacturer's advantage to have his customers obtain the best possible results with his product.

Many manufacturers of sensitized materials make available the most useful of their formulas in prepared form for large and smaller users. All the photographer needs to do is to dissolve the powders in the proper volume of water as directed in the instructions printed on the package, in order to have the best possible formula for his particular job. This method is especially recommended for people doing only occasional photographic processing since each batch is fresh when used and, because of the small volumes available, it is not necessary to save solutions in the interest of economy. This method also eliminates the necessity of maintaining large stocks of the individual chemicals necessary.

DEVELOPERS

Fine Grain (Kodak DK-20)

	Avoirdupois	Metric
Water, about 125°F. (50°C.)	96 ounces	750.0 c.c.
Elon	290 grains	5.0 grams
Sodium Sulfite, desiccated	13¼ ounces	100.0 grams
Kodalk	116 grains	2.0 grams
Sodium Thiocyanate (Sulfocyanate)	58 grains	1.0 gram
Potassium Bromide	29 grains	0.5 gram
Cold water to make	1 gallon	1.0 liter

Dissolve chemicals in the order given.

Time of development, 15 to 25 minutes in a tank at 65°F. (18°C.) according to the contrast desired. Decrease the time about 20% for tray use. Develop underexposures fully for best results.

High Contrast (Kodak D-19)

STOCK SOLUTION

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	64 ounces	2.0 liters
Elon	128 grains	8.8 grams
Sodium Sulfite, desiccated	12 ozs. 360 grains	384.0 grams
Hydroquinone	1 oz. 75 grains	35.2 grams
Sodium Carbonate, desiccated	6 ozs. 180 grains	192.0 grams
Potassium Bromide	290 grains	20.0 grams
Cold water to make	1 gallon	4.0 liters

Dissolve chemicals in the order given.

Use without dilution. Develop 3 to 6 minutes in a tray at 65°F. (18°C.) according to the contrast desired. Increase the time about 25% for tank development.

For infrared landscape photography, dilute as follows: stock solution 1 part, water 4 parts. Develop about 5 minutes at 65°F. (18°C.).

This developer may also be used for x-ray films and in most cases where high contrast is desired.

PHOTOGRAPHIC FORMULAS

Low Contrast (Kodak D-76)

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	96 ounces	3.0 liters
Elon	116 grains	8.0 grams
Sodium Sulfite, desiccated	13¼ ounces	400.0 grams
Hydroquinone	290 grains	20.0 grams
Borax, granular	116 grains	8.0 grams
Water to make	1 gallon	4.0 liters

Dissolve chemicals in the order given.

Develop amateur roll films and aero films about 20 minutes in a tank or 16 minutes in a tray of fresh developer at 65°F. (18°C.).

Develop professional films and plates 10 to 25 minutes in a tank at 68°F. (18°C.) according to the contrast desired. For tray use, decrease the time about 20%. This developer gives greatest shadow detail on fine grain panchromatic films.

A faster working developer can be obtained by increasing the quantity of borax. A still more active developer can be obtained by replacing the borax by Kodalk.

The developer may become slightly muddy due to the formation of a suspension of colloidal silver but this is harmless and can be ignored.

For duplicate negative film, average time of development is 6 to 9 minutes at 65°F. (18°C.).

Extreme Contrast (Kodak D-8)

STOCK SOLUTION

	Avoirdupois	Metric
Water	96 ounces	3.0 liters
Sodium Sulfite, desiccated	12 ounces	360.0 grams
Hydroquinone	6 ounces	180.0 grams
Sodium Hydroxide (Caustic Soda)	5 ounces	150.0 grams
Potassium Bromide	4 ounces	120.0 grams
Water to make	1 gallon	4.0 liters

Dissolve chemicals in the order given. Stir the solution thoroughly before use.

For use, take 2 parts of stock solution and 1 part of water. Develop about 2 minutes in a tray at 65°F. (18°C.). This formula is especially recommended for making line and half-tone screen negatives for printing directly on metal.

A formula which is slightly less alkaline and gives almost as much density can be obtained by using 3¾ ounces of sodium hydroxide per gallon of stock solution (112 grams per 4 liters) instead of the quantity given in the formula.

General Elon-Hydroquinone (Kodak D-61a)

STOCK SOLUTION

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	16 ounces	500.0 c.c.
Elon	45 grains	3.1 grams
Sodium Sulfite, desiccated	3 ounces	90.0 grams
Sodium Bisulfite	30 grains	2.1 grams
Hydroquinone	85 grains	5.9 grams
Sodium Carbonate, desiccated	165 grains	11.5 grams
Potassium Bromide	24 grains	1.7 grams
Cold water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

For *tray* use take 1 part of stock solution to 1 part of water. Develop for about 7 minutes at 65°F. (18°C.)

For *tank* use take 1 part of stock solution and 3 parts of water. At a temperature of 65°F. (18°C.), the development time is about 14 minutes. It is advisable to make up a greater quantity than is needed to fill the tank. If the developer in the tank is of normal strength, but the volume of solution has been reduced, add a sufficient quantity of the surplus solution diluted 1:3 to fill the tank.

PHOTOGRAPHIC FORMULAS

Photomicrographic Low and Medium Contrast (D-76c)

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	96 ounces	3.0 liters
Elon	116 grains	8.0 grams
Sodium Sulfite, desiccated	13¼ ounces	400.0 grams
Hydroquinone	290 grains	20.0 grams
Borax, granular	116 grains	8.0 grams
Potassium Iodide, 1% solution	1 dram	4.0 c.c.
Potassium Bromide, 2.5% solution	10 drams	40.0 c.c.
Cold water to make	1 gallon	4.0 liters

Dissolve chemicals in the order given.
Use without dilution.

For low contrast, develop about 5 minutes, and for normal contrast, about 6½ minutes, at 65°F. (18°C.) in a tray of fresh developer. Increase the time about 25% for tank development.

Photomicrographic High Contrast (D-19) See formula D-19 given previously.

Tropical Non-blistering (Kodak DK-15)

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	24 ounces	750.0 c.c.
Elon	82 grains	5.7 grams
Sodium Sulfite, desiccated	3 ounces	90.0 grams
Kodalk (Potassium Metaborate)	¾ ounce	22.5 grams
Potassium Bromide	27 grains	1.9 grams
* Sodium Sulfate, desiccated	1½ ounces	45.0 grams
Cold water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

Average time for tank development is 9 to 12 minutes at 65°F. (18°C.) and 2 to 3 minutes at 90°F. (32°C.), in the fresh developer according to the contrast desired. When working *below* 75°F. (24°C.) the sulfate may be omitted if a more rapid formula is required. Development time *without* the sulfate is 5 to 7 minutes at 65°F. (18°C.). Develop about 20 per cent less for tray use.

When development is completed rinse the film or plate in water for 1 or 2 seconds only and immerse in the Tropical Hardener (Formula SB-4) for 3 minutes (omit water rinse if film tends to soften); then fix for at least 10 minutes in an acid hardening fixing bath, such as Formula F-5, and wash for 10 to 15 minutes in water (not over 95°F.) (35°C.).

Further details on tropical development will be found in the booklet "Tropical Development" obtainable on request from the Eastman Kodak Co., Rochester, N. Y.

Infrared Medium Contrast (D-76) See formula D-76 given previously.

Infrared High Contrast (D-19) See formula D-19 given previously.

Lantern Slide (Kodak D-32)

STOCK SOLUTION A	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	16 ounces	500.0 c.c.
Sodium Sulfite, desiccated	90 grains	6.3 grams
Hydroquinone	100 grains	7.0 grams
Potassium Bromide	50 grains	3.5 grams
Citric Acid	10 grains	0.7 gram
Cold water to make	32 ounces	1.0 liter
STOCK SOLUTION B		
Cold water	32 ounces	1.0 liter
Sodium Carbonate, desiccated	1 ounce	30.0 grams
Sodium Hydroxide (Caustic Soda)	60 grains	4.2 grams

* If it is desired to use crystalline sodium sulfate instead of the desiccated sulfate then 3½ ounces per 32 ounces (105 grams per liter) should be used.

PHOTOGRAPHIC FORMULAS

Dissolve chemicals in the order given.

For use, take 1 part of A and 1 part of B. For warmer tones, 1 part of A and 2 parts of B.

Develop about 5 minutes at 70°F. (21°C.).

Oscillograph, Cardiograph, and other line record materials.

See high contrast developer formula D-19 given previously.

Universal Paper (Kodak D-72)

STOCK SOLUTION

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	16 ounces	500.0 c.c.
Elon	45 grains	3.1 grams
Sodium Sulfite, desiccated	1½ ounces	45.0 grams
Hydroquinone	175 grains	12.0 grams
Sodium Carbonate, desiccated	2¼ ounces	67.5 grams
Potassium Bromide	27 grains	1.9 grams
Water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

For chloride papers take stock solution 1 part, water 2 parts. Develop 45 seconds at 70°F. (21°C.).

For bromide papers take stock solution 1 part, water 4 parts. Develop not less than 1½ minutes at 70°F. (21°C.).

For lantern slides take stock solution 1 part, water 2 parts. Develop 1 to 2 minutes at 70°F. (21°C.). For greater contrast dilute 1:1 and for less contrast dilute 1:4.

Warm Tone Paper (Kodak D-52)

STOCK SOLUTION

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	16 ounces	500.0 c.c.
Elon	22 grains	1.5 grams
Sodium Sulfite, desiccated	¾ ounce	22.5 grams
Hydroquinone	90 grains	6.3 grams
Sodium Carbonate, desiccated	½ ounce	15.0 grams
Potassium Bromide	22 grains	1.5 grams
Cold water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

For professional contact papers, use stock solution 1 part, water 1 part.

For professional enlarging papers and bromide papers, use full strength solution.

Develop all papers not less than 1½ minutes at 70°F. (21°C.).

FIXING BATHS

Acid Hardening (Kodak F-5)

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	20 ounces	600.0 c.c.
Sodium Thiosulfate (Hypo)	8 ounces	240.0 grams
Sodium Sulfite, desiccated	½ ounce	15.0 grams
*Acetic Acid (28% pure)	1½ fluid ozs.	48.0 c.c.
**Boric Acid, crystals	¼ ounce	7.5 grams
Potassium Alum	½ ounce	15.0 grams
Cold water to make	32 ounces	1.0 liter

Dissolve the hypo in the specified volume of water (about 125°F.) (52°C.) and then add the remaining chemicals in the order given, taking care that each chemical is dissolved before adding the next. Then dilute with water to the required volume.

The F-5 fixing bath has the advantage over the older type of fixing baths, which do not contain boric acid, in that it gives much better hardening and has a lesser tendency to precipitate a sludge of aluminum sulfite throughout its useful life.

* To make 28% acetic acid from glacial acetic acid, dilute three parts of glacial acetic acid with eight parts of water.

** Crystalline boric acid should be used as specified. Powdered boric acid dissolves only with great difficulty, and its use should be avoided.

PHOTOGRAPHIC FORMULAS

Non-hardening (Kodak F-24)

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	16 ounces	500.0 c.c.
Sodium Thiosulfate (Hypo)	8 ounces	240.0 grams
Sodium Sulfite, desiccated	145 grains	10.0 grams
Sodium Bisulfite	365 grains	25.0 grams
Cold water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

This bath is recommended for films, plates or paper when no hardening is desired. It may be used satisfactorily only in case the temperature of the developer, rinse bath, and wash water is not higher than 65°F. (18°C.), and provided ample drying time is allowed so that relatively cool drying air can be used.

MISCELLANEOUS

Acid Rinse Bath (Kodak SB-1); Short Stop

	Avoirdupois	Metric
Water	32 ounces	1.0 liter
*Acetic Acid (28% pure)	1½ fluid ozs.	48.0 c.c.

Rinse prints for at least 5 seconds.

With a 1 to 2 second drain, the equivalent of approximately twenty-five 8 by 10 prints may be processed by 1 quart (1 liter) of this bath before it becomes alkaline and should be discarded.

Hardener-Rinse Bath (Kodak SB-3)

	Avoirdupois	Metric
Water	32 ounces	1.0 liter
Potassium Chrome Alum	1 ounce	30.0 grams

This bath is intended for use in hot weather after development and before fixation in conjunction with formula F-5.

Agitate the negatives for several seconds when first immersed in the hardener and allow to remain in the solution for 3 to 5 minutes to secure maximum hardening.

IMPORTANT: The bath should be renewed frequently and if there is any tendency for scum to form on the films, it should be removed by swabbing with cotton. The bath should be skimmed each day before use.

Intensifier (Kodak IN-4)

STOCK SOLUTION	Avoirdupois	Metric
Potassium Bichromate	3 ounces	90.0 grams
Hydrochloric Acid, C. P.	2 fluid ozs.	64.0 c.c.
Water to make	32 ounces	1.0 liter

For use, take 1 part of stock solution to 10 parts of water.

Harden the negative with an alkaline solution of formalin (Formula SH-1) before treatment with the chromium intensifier, or the gelatin may reticulate and ruin the negative.

Bleach thoroughly at 65°F. (18°C.), then wash five minutes and redevelop fully (about 5 minutes) in artificial light or daylight (not sunlight) in any quick-acting, non-staining developer containing the normal proportion of bromide, such as Formula D-72, diluted 1:3. If the negative is not redeveloped fully then fix for five minutes, and wash thoroughly. Fixing is unnecessary if redevelopment is thorough. The degree of intensification may be controlled by varying the time of redevelopment. Greater intensification can be secured by repetition.

Warning: Developers containing a high concentration of sulfite, such as Formula D-76, are not suitable for redevelopment, since the sulfite tends to dissolve the bleached image before the developing agents have time to act on it.

Negatives intensified with chromium are more permanent than those intensified with mercury.

* To make 28% acetic acid from glacial acetic acid dilute three parts of glacial acetic acid with eight parts of water.

PHOTOGRAPHIC FORMULAS

The Eastman Chromium Intensifier Powders are equally as satisfactory as Formula In-4, and are supplied in prepared form ready to use simply by dissolving in water.

Reducer (Kodak R-4a)

STOCK SOLUTION A

	Avoirdupois	Metric
Potassium Ferricyanide	1¼ ounces	37.5 grams
Water to make	16 ounces	500.0 c.c.

STOCK SOLUTION B

Sodium Thiosulfate (Hypo)	16 ounces	480.0 grams
Water to make	64 ounces	2.0 liters

For use take: Stock Solution A, 1 ounce (30 c.c.), stock solution B, 4 ounces (120 c.c.), and water to make 32 ounces (1 liter). Add A to B, then add the water.

Pour the mixed solution at once over the negative to be reduced. Watch closely. The action is best seen when the solution is poured over the negative in a white tray. When the negative has been reduced sufficiently, wash thoroughly before drying.

Solutions A and B should not be combined until they are to be used. They will not keep long in combination.

Hand Stain Remover (Kodak S-5)

SOLUTION NO. 1

	Avoirdupois	Metric
Potassium Permanganate	¼ ounce	7.5 grams
Water	32 ounces	1.0 liter

SOLUTION NO. 2

Sodium Bisulfite	16 ounces	480.0 grams
Water	32 ounces	1.0 liter

Rub the hands with a small amount of the No. 1 solution, rinse in water; then rinse with the No. 2 solution which will remove the stains.

Tray Cleaner (Kodak TC-1)

	Avoirdupois	Metric
Water	32 ounces	1.0 liter
Potassium Bichromate	3 ounces	90.0 grams
Sulfuric Acid, C.P.	3 fluid ozs.	96.0 c.c.

Add the sulfuric acid slowly while stirring the solution rapidly.

For use, pour a small volume of the tray cleaner solution in the vessel to be cleaned. Rinse around so that the solution has access to all parts of the tray; then pour the solution out and wash the tray six or eight times with water until all traces of the cleaning solution disappear.

Desensitizer

In the development of panchromatic emulsions it is necessary to work in absolute darkness, or with the very dense panchromatic safelight. When visual control of development is necessary, Pinacryptol Green is used as a desensitizer. Two methods are available for using this material, namely in a preliminary bath, or mixed with the developing solution. As it is sometimes necessary to change the method used, it has been found best to make up a stock solution of the following proportions:

Pinacryptol Green	1 part
Water	500 parts

To use this solution as a separate preliminary bath, the stock solution is diluted 10 times, making a solution of 1 in 5000 in the tray. If the desensitizer is to be used in the developer, the stock solution is added in the ratio of 1 ounce of solution to every 10 ounces of developer. After the film has been immersed in the solution a minute, the red light may be turned on, but to be absolutely safe it is best to use a strong green light.

Special Formalin Hardener (Kodak SH-1)

Formalin (37% formaldehyde solution)	2½ drams	10.0 c.c.
Sodium Carbonate	73 grains	5.0 grams
Water to make	32 ounces	1.0 liter

PHOTOGRAPHIC FORMULAS

This formula is recommended for the treatment of negatives which would normally be softened considerably by a chemical treatment in the removal of several types of stains, or by intensification or reduction.

After treatment for 3 minutes in the hardening solution, films or plates should always be rinsed and immersed for 5 minutes in a fresh acid fixing bath and well washed before giving any further chemical treatment.

Tropical Hardener (Kodak SB-4)

This solution is recommended for use in conjunction with the Tropical Developer (Formula DK-15), when working above 75°F. (24°C.).

	Avoirdupois	Metric
Water	32 ounces	1.0 liter
Potassium Chrome Alum	1 ounce	30.0 grams
*Sodium Sulfate, desiccated	2 ounces	60.0 grams

Agitate the negatives for 30 to 45 seconds when first immersing in the hardener, or streakiness will result. Leave them in the bath for at least 3 minutes between development and fixation. If the temperature of the developer is below 85°F. (29°C.) rinse for 1 to 2 seconds in water before immersing in the chrome alum hardener bath. The hardening bath is a violet blue color by tungsten light when freshly mixed, but it ultimately turns a yellow-green with use; it then ceases to harden and should be replaced with a fresh bath. The hardening bath should never be overworked. An unused bath will keep indefinitely, but the hardening properties of a partially used bath fall off rapidly on standing for a few days.

Chrome Alum-Bisulfite Hardener

	Avoirdupois	Metric
Water	1 pint	500 c.c.
Potassium Chrome Alum	150 grains	10 grams
Sodium Bisulfite	150 grains	10 grams

Negatives are allowed to remain in this bath for 4-6 minutes. A freshly prepared bath is to be used and discarded after one day's use. Where stock solutions must be kept on hand, the chrome alum and the bisulfite are made up into separate solutions of 20 grams each per liter of water (300 grains per quart). Equal portions of these solutions are mixed when needed.

Hypo Eliminator (Kodak HE-1)

	Avoirdupois	Metric
Water	16 ounces	500.0 c.c.
Hydrogen Peroxide, (3% sol'n.)	4 ounces	125.0 c.c.
Ammonia, (3% sol'n.)	3¼ ounces	100.0 c.c.
Water to make	32 ounces	1.0 liter

Wash the prints for about 30 minutes at 65° to 70°F. in running water which flows rapidly enough to replace the water in the vessel (tray or tank) completely once every 5 minutes. Then immerse each print about 6 minutes at 70°F. in hypo eliminator solution (HE-1) and finally wash about 10 minutes before drying. Further details on the use of this formula will be found by referring to the paper "Elimination of Hypo from Photographic Images" by Crabtree, Eaton, and Muehler, *Jour. Phot. Soc. Amer. 6, page 6, (1940).*

Hypo Test

Process with the batch of prints an unexposed white sheet of photographic paper of the same weight and size as the majority of prints in the batch. After the final wash, cut off a strip of this sheet and immerse it in a 1 per cent solution of silver nitrate solution for about 3 minutes; then rinse in water and compare, while wet, in subdued daylight or artificial light with the wet, untreated portion. If the hypo has been completely removed no color difference should be observed. A yellow-brown stain indicates the presence of hypo.

* If it is desired to use crystalline sodium sulfate instead of the desiccated sulfate, then use 4 ounces 290 grains per 32 ounces (140 grams per liter) when mixing the formula.

PHOTOGRAPHIC FORMULAS

TONERS FOR SLIDES AND FILMS

Uranium Toner (Kodak T-9) For Brown to Red Tones

	Avoirdupois	Metric
Uranium (Uranyl) Nitrate	35 grains	2.5 grams
Potassium Oxalate	35 grains	2.5 grams
Potassium Ferricyanide	15 grains	1.0 gram
Ammonium Alum	85 grains	6.0 grams
Hydrochloric Acid, 10% sol	1¼ drams	5.0 c.c.
Water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

The solution should be perfectly clear and pale yellow in color. *It is light sensitive, however, and should be stored in the dark.* The maximum effect is produced in about 10 minutes, the tone passing from brown to red during this time.

It is convenient to keep 10% stock solutions of the constituent chemicals of the above toning bath for quick compounding of a new bath.

For motion picture work, 120 gallons of the above bath will tone about 12,000 feet of film without any appreciable change in the tone. A volume of acid may then be added equal to that originally used, when a further 12,000 feet may be toned. After toning the second quantity of film, the bath should be discarded.

After toning, wash for about 10 minutes, though the washing should not be prolonged, especially if the water is slightly alkaline, since the toned image is soluble in alkali.

Sulfide Toner (Kodak T-10) For Sepia Tones

SOLUTION A	Avoirdupois	Metric
Potassium Ferricyanide	1 ounce	30.0 grams
Potassium Bromide	½ ounce	15.0 grams
Water to make	32 ounces	1.0 liter
SOLUTION B		
*Sodium Sulfide, fused (not sulfite)	13 grains	0.9 gram
Water to make	32 ounces	1.0 liter

The well washed slide is thoroughly bleached in A, washed for 5 minutes, and immersed in Solution B for about 2 minutes until thoroughly toned. The slide should then be washed thoroughly for 10 to 15 minutes before drying. The transparency of the tone is much improved by the addition of a little hypo to the B solution, say, 66 grains per 32 ounces or 4.5 grams per liter.

Iron Toner (Kodak T-11) For Blue Tones

	Avoirdupois	Metric
Ammonium Persulfate	7 grains	0.5 gram
Iron and Ammonium Sulfate (Ferric Alum)	20 grains	1.4 grams
Oxalic Acid	45 grains	3.0 grams
Potassium Ferricyanide	15 grains	1.0 gram
Ammonium Alum	75 grains	5.0 grams
Hydrochloric Acid 10%	¼ dram	1.0 c.c.
Water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

The method of compounding this bath is very important. Each of the solid chemicals should be dissolved separately in a small volume of water, the solutions then mixed strictly in the order given, and the whole diluted to the required volume. If these instructions are followed, the bath will be pale yellow in color and perfectly clear.

Immerse the slides or films from 2 to 10 minutes at 70°F. (21°C.) until the desired tone is obtained. Wash for 10 to 15 minutes until the highlights are clear. A very

* Use three times the quantity of crystalline sodium sulfide.

slight permanent yellow coloration of the clear gelatin will usually occur, but should be too slight to be detectable on projection. If the highlights are stained blue, then either the slide (film) was fogged during development, or the toning bath was stale or not mixed correctly.

Since the toned image is soluble in alkali, washing should not be carried out for too long a period, especially if the water is slightly alkaline.

Dye Toners (Kodak T-20)

	Avoirdupois	Metric
*Dye	x grains	x grams
Acetone or Wood Alcohol	3¼ fluid ozs.	100.0 c.c.
Potassium Ferricyanide	15 grains	1.0 gram
Acetic Acid (glacial)	1¼ drams	5.0 c.c.
Water to make	32 ounces	1.0 liter

The nature of the tone varies with time of toning and eventually a point is reached beyond which it is unsafe to continue as the gradation of the toned image becomes affected. Average toning time at 65°F. (18°C.) is from 3 to 9 minutes. Further details on the use of this formula may be obtained by referring to the paper by Crabtree and Ives.†

ORGANIC COMPOUNDS USED AS PHOTOGRAPHIC DEVELOPERS

Acrol—See amidol.
Activol—See rhodinal.
Adurol—See chlorohydroquinone and bromohydroquinone.
Amidol (Acrol; Diamol; Nerol)—2, 4-Diaminophenol dihydrochloride, $C_6H_3(OH)(NH_2)_2 \cdot 2HCl$.
Athenon—See glycin.
Azol—See rhodinal.
Brom(o)hydroquinone (Adurol-Schering) — 2-Bromo-1, 4-dihydroxybenzene, $BrC_6H_3(OH)_2$.
Catechol—See pyrocatechin.
Certinal—See rhodinal.
Chloranol—A combination of chlorohydroquinone and metol base, $ClC_6H_3(OH)_2 \cdot (CH_3NH)C_6H_4OH$.
Chlornol—See chlorohydroquinone. Not to be confused with chloranol (*q.v.*)
Chlor(o)hydroquinone (Adurol-Hauff; C.H.Q.; Chlornol; Quinotol)—2-Chloro-1, 4-dihydroxybenzene, $ClC_6H_3(OH)_2$.
C.H.Q.—See chlorohydroquinone.
Citol—See rhodinal.
Diamine-H—See para-phenylenediamine hydrochloride.
Diamine-P—See para-phenylenediamine.
Diaminophenol—See amidol.
Diamol—A trade name for either amidol (*q.v.*) or para-phenylenediamine base (*q.v.*) The term used in French literature usually refers to amidol. In the U.S.A. the term is a trade name of one company for its *p*-phenylenediamine.
Diogen—Sodium α-aminonaphthol-disulfonate, $NH_2C_{10}H_4(SO_3Na)_2OH$, (1:3:6:8)?
Diolene—See ortho-phenylenediamine.
Duratol—p-Benzylaminophenol, $C_6H_5CH_2 \cdot NHC_6H_4OH$.

* The quantity of dye varies according to the dye used as follows:

Safranine (Extra Bluish)	3 grains	0.2 gram
Chrysoidine 3R	3 grains	0.2 gram
Auramine	6 grains	0.4 gram
Victoria Green	6 grains	0.4 gram
Rhodamine B	6 grains	0.4 gram

All dyes listed can be supplied by the National Aniline and Chemical Co., 40 Rector St., New York, N. Y.

† "Dye Toning With Single Solutions" by J. I. Crabtree and C. E. Ives. *Trans. Soc. Mot. Pict. Eng.* *12: 967 (1928).*

PHOTOGRAPHIC FORMULAS

Edinol—*m*-Hydroxymethyl-*p*-hydroxyaniline hydrochloride, $(CH_2OH)(OH)C_6H_3NH_2 \cdot HCl$.
Eikonogen—Sodium aminonaphtholsulfonate, $(NH_2)(HO)(SO_3Na)C_{10}H_5 \cdot 2\frac{1}{2}H_2O$ (1:2:6)
Elon—See metol.
Finegrainol—Undisclosed formula; probably a mixture or a double salt of two of the more common developing agents together with small amounts of some other substance.
Genol—See metol.
Glycin (Athenon; Monazol)—*N*-(*p*-Hydroxyphenyl)-glycine; (*p*-hydroxyphenylamino)-acetic acid, $HOC_6H_4 \cdot NHCH_2CO_2H$.
Gradol—Undisclosed formula; probably a derivative of *p*-aminophenol.
Hydramine—A combination of hydroquinone and *p*-phenylenediamine, $C_6H_4(OH)_2 \cdot C_6H_4(NH_2)_2$.
Imogen—AGFA compound not made public.
Hydroquinone—*p*-Dihydroxybenzene, $C_6H_4(OH)_2$.
Kachin—See pyrocatechin.
Kodelon—See par(a)aminophenol.
Meritol—A combination of pyrocatechin and *p*-phenylenediamine, $C_6H_4(OH)_2 \cdot C_6H_4(NH_2)_2$.
Metol (Elon; Genol; Monotol; Photol; Pictol, Rhodol; Satrapol; Veritol)—*p*-Methylaminophenol sulfate, $HOC_6H_4(NHCH_3) \cdot \frac{1}{2}H_2SO_4$.
Metoquinone—A combination of hydroquinone and metol base, $C_6H_4(OH)_2 \cdot 2C_6H_4(OH)(NHCH_3)$.
Monazol—See glycin.
Monomet—*p*-Amino-*o*-cresol hydrochloride, $C_6H_3(CH_3)(OH)(NH_2) \cdot HCl$ (1:2:5).
Monotol—See metol.
Neol—Aminosalicylic acid, $C_6H_3(NH_2)(OH)(CO_2H)$ (5:2:1).
Nerol—See amidol.
Orthamine—See ortho-phenylenediamine.
Ortho-phenylenediamine (Diolene; Orthamine) — 1, 2-Diaminobenzene, $C_6H_4(NH_2)_2$.
Ortol—A mixture of hydroquinone and *o*-methylaminophenol sulfate, $C_6H_4(OH)_2 + C_6H_4(OH)(NHCH_3) \cdot \frac{1}{2}H_2SO_4$.
Paraminol—A condensation product of hydroquinone and *p*-aminophenol.
Par(a)aminophenol (Kodelon)—*p*-Aminophenol, usually sold as the oxalate or the hydrochloride salt. Free base: $C_6H_4(OH)(NH_2)$; Kodelon: $C_6H_4(OH)(NH_2) \cdot HCl$.
Paranol—See rhodinal.
Para-phenylenediamine (Diamine-P; Diamol) — 1, 4-Diaminobenzene. $C_6H_4(NH_2)_2$.
Para-phenylenediamine Hydrochloride (Diamine-H; P.D.H.)—1, 4-Diaminobenzene dihydrochloride, $C_6H_4(NH_2)_2 \cdot 2HCl$.
P.D.H.—See para-phenylenediamine hydrochloride.
Phenylenediamine—See para-phenylenediamine and ortho-phenylenediamine.
Photol—See metol.
Pictol—See metol.
Pyrocatechin (Catechol; Kachin)—*o*-Dihydroxybenzene, $C_6H_4(OH)_2$.
Pyro—See pyrogallol.
Pyrogallic Acid—See pyrogallol.
Pyrogallol (Pyro; Pyrogallic Acid)—1, 2, 3-Trihydroxybenzene, $C_6H_3(OH)_3$.
Quinotol—See chlorohydroquinone.
Reducin—1, 3, 5-Triamino-2-hydroxybenzene trihydrochloride, $C_6H_2(OH)(NH_2)_3 \cdot 3HCl$.
Rhodinal (Activol; Azol; Certinal; Citol; Paranol)—Sodium *p*-aminophenolate, $C_6H_4(NH_2)(ONa)$. Usually sold in the form of a solution.
Rhodol—See metol.
Rubinol—Undisclosed formula; probably a derivative of pyrogallol.
Satrapol—See metol.
Veritol—See metol.

PHOTOGRAPHIC FORMULAS

TRADE NAMES AND CHEMICAL SYNONYMS OF DYES FOR SENSITIZING PHOTOGRAPHIC PLATES

Trade Name	Chemical Name	Sensitizer for
Ethyl red	1, 1′-diethylisocyanine iodide	Green and yellow
Pinachrome	1, 1′-diethyl-6, 6′-diethoxyisocyanine bromide	Green and orange
Pinaverdol	1, 1′, 6-trimethylisocyanine iodide	Green and yellow
Sensitol green	cf. pinaverdol.	
Pinacyanol	1, 1′-diethyl-2, 2′-carbocyanine iodide	Orange and red
Sensitol red	cf. pinacyanole	Orange and red
Erythrosin	Sodium salt of tetra-iodo fluorescein	Yellow-green
Orthochrome T	6, 6′-dimethyl-1, 1′-diethylisocyanine iodide	Green
Kryptocyanine	1, 1′-diethyl-4, 4′-carbocyanine iodide	Infra red
Dicyanine A	4′, 2-dimethyl-1, 1′-diethyl-6, 6′-diethoxy-2, 4′-carbocyanine iodide	Extreme red
Neocyanine	1, 1′-diethyl-8-(4-quinolyl ethiodide) methyl 4, 4′-carbocyanine iodide	Infra red

COMPARATIVE PHOTOGRAPHIC EMULSION SPEED RATINGS

The data in this table have been taken from *Popular Photography* 20, *90* (*1947*), copyright by Ziff-Davis Publishing Co., Chicago, 1947, and printed here by permission.

This table must be used with caution because the various speed ratings, being based upon entirely different principles, cannot be compared directly with each other. It must be borne in mind that an effective speed of a given emulsion depends upon the type and character of developer used in processing.

Relative Value	ASA Index	General Electric	Weston Numbers	Scheiner		H & D		DIN Degrees
				American	European	American	European	
106.66	0.6	0.6	0.5	6	12

0.13	500	600	400	35	41			28/10
0.10	650	800	500	36	42			29/10
0.08	800	900	650	37	43			30/10
0.06	1000	1000	800	38	44			31/10

ASA Arithmetic Exposure Index	Logarithmic Exposure Index
200	34°
160	33°
125	32°
100	31°
80	30°
64	29°
50	28°
40	27°
32	26°

To double the arithmetic exposure index multiply the value by 2; to halve the arithmetic exposure index divide the value by 2. To double the logarithmic exposure index add 3 to the value; to halve the logarithmic exposure index subtract 3 from the value.

PHOTOGRAPHIC FILM EMULSIONS

Most of the information in the following table was obtained from *Photography* 30. *150* (*1952*), copyright by Ziff-Davis Publishing Co., New York, 1952. and printed here by permission.

The following table gives an *approximate* comparison of the properties of various photographic emulsions. It should not be considered as a comparison of products from different manufacturers. The speed ratings are subject to a number of variables such as the spectral quality of light used for exposure, the type of developer, the method of development, age of the emulsion, etc. Therefore, this table is to be used merely as a guide to selecting various films and to depend upon the values supplied by the manufacturer of the exposure meter being used and the method of development recommended by the manufacturer of the film.

The filter factors are those established for the well-known Wratten filters. It should be noted that properties given in the column headed *Characteristics and Special Properties* will vary with different methods and procedures of development.

The manufacturers are indicated by abbreviations as follows: A, Anken; AN, Ansco; Df, Dufay; DP, Du Pont; DA, Dassonville; DV, Dover; E, Eastman; G, Gevaert; SR, Sears. Roebuck; ST, Super-Tomic; W, Weimet.

Notations: † Exact factors for cut film vary with different batches and are supplied by the manufacturer in each package. Read meter from reflection of white surface placed over copy. ** With Wratten 85B filter. ‡ With Wratten A (No. 25) filter. With Wratten 80A filter. § With filter recommended by the manufacturer. # Can be processed by the user. ## Processed by the manufacturer.

LABORATORY ARTS AND RECIPES

PLATINUM (Courtesy J. Bishop and Co. Platinum Works, Malvern, Pa.)

1. Purposes for which Platinum can be used

A—Fusions

1. Fusions with sodium carbonate or fusion mixture.
2. Fusions with sodium carbonate and sodium nitrate or nitrite.
3. Fusions with sodium borate or sodium metaphosphate.
4. Fusions with alkali bifluorides.
5. Fusions with alkali or alkaline earth chlorides.
6. Fusions with alkali bisulfates.

Loss of weight of the platinum amounts to only a fraction of a milligram in case 1 and is practically nil in case 4. Nitrates or nitrites in the fusion mixture (case 2) cause heavier losses of platinum, but under the usual laboratory conditions these are not likely to exceed 1-2 mg. Borax is inert to platinum and sodium metaphosphate attacks the metal only at very high temperatures or under reducing conditions. Alkali chlorides and alkaline earth chlorides attack the metal above 1000° C. in the presence of air which liberates chlorine from the fused salt; in a neutral atmosphere they are inert. Alkali bisulfates attack platinum slightly above 700° C.; the attack is diminished by addition of ammonium sulfate.

In all cases except case 4, traces of platinum should be looked for in the solutions when making accurate analyses; the platinum is precipitated with the hydrogen sulfide group.

B—Evaporations

1. Evaporations with sulfuric acid with or without hydrofluoric acid.
2. Evaporations with hydrofluoric acid.
3. Evaporations with hydrofluoric and nitric acids in the absence of halides, especially chlorides.
4. Evaporations with hydrochloric acid in the absence of oxidizing agents which yield nascent chlorine.
5. Evaporations with alkali hydroxides or carbonates to avoid contamination of the solution with silica, etc.
6. Evaporations with sodium peroxide solutions (cf. II. C. 6).

C—Ignitions

1. Ignition of barium sulfate.
2. Ignition of alkaline earth carbonates, oxalates, etc.
3. Ignition of sulfates of metals which are not readily reducible.
4. Ignition of oxides which are not readily reducible, e. g., Al_2O_3, MgO, BaO, CaO, SrO, TiO_2, ZrO_2, ThO_2, MoO_3, WO_3, Ta_2O_5, Cr_2O_3, Mn_3O_4, and in the absence of carbonaceous matter ZnO, Co_3O_4, NiO, CdO.
5. Determination of ash in organic materials, e. g., coke, coal, plants.

The carbonaceous matter should be burnt off at as low a temperature as possible with free access of air to avoid danger of contamination of the platinum with sulfur, phosphorus, iron, etc., derived from reduction of sulfates, phosphates, iron compounds, etc., present in the material.

6. Determination of volatile matter in fuels. Here the maintenance of a non-oxidizing atmosphere is essential to prevent loss of fixed carbon hence there is a greater danger of contamination of the platinum, especially when the fuel is rich in sulfur or phosphorus compounds.

D—Electrolytic Operations

1. As an anode in most electrolytes except strongly acid chloride solution.
2. As cathode for the deposition of metals from acid, alkaline or ammoniacal solutions. For the deposition of zinc, gallium and bismuth, the platinum should first be copper-plated to prevent superficial alloying with the deposited metal.

Atmospheres in Which Platinum Can Be Heated:

1. Air, nitrogen and oxygen up to the melting point of platinum.
2. Oxides of nitrogen.
3. Bromine and iodine vapor.
4. Hydrogen, carbon dioxide.

2. *Conditions Under which Platinum is Attacked*

A—By Heating in Atmospheres Containing the Following Gases:

1. Ammonia: the surface becomes darker, less lustrous and soon develops pores and a crystalline appearance.
2. Sulfur dioxide: sulfur trioxide is formed and the platinum surface becomes coated with platinous sulfide.
3. Chlorine: the metal becomes converted into a mass of crystals due to the alternate formation and decomposition of platinous chloride.
4. Volatile chlorides especially those which readily decompose.
5. Highly carburetted gases and vapors; the metal disintegrates, possibly with the formation of PtC_2, and becomes very brittle. Hence platinum ware should never be heated in the reducing zone of a gas flame.

B—By Heating in the Following Liquids:

1. Aqua Regia.
2. Hydrochloric acid and oxidizing agents.
3. Concentrated sulfuric acid. The action is extremely slow and, for all laboratory purposes, negligible.
4. Concentrated phosphoric acid. Here again the action is noticeable only after very prolonged heating.

C—By Heating in the Following Solids, Their Fusions or Vapors:

1. Sulfur, selenium and tellurium. The action of sulfur vapor is very slow, and prolonged heating is required to produce any sericus effect; selenium and tellurium readily combine with platinum.
2. Phosphorus, arsenic and antimony. Combination with platinum occurs readily at a red heat.
3. Magnesium pyrophosphate above 900° C.
4. Silica and borax at high temperatures.
5. Molten lead, zinc, tin, bismuth, silver, gold, or copper or mixtures which form these metals by reduction.
6. Fused alkali oxides and peroxides, and, to a smaller extent in the presence of air, alkali hydroxides.
7. Fused nitrates. The action is intensified by the presence of alkali hydroxides or carbonates but in no case is it very severe (see I. A. 2 *et seq.*).
8. Phosphorus pentoxide or phosphoric acid. The action is relatively small.
9. Fused cyanides. Platinocyanides are formed.
10. Iron oxide above 1200° C. Oxygen is liberated and the iron combines with the platinum.
11. Silica, silicates, alumina and magnesia above 1600° C. At lower temperatures no action occurs.
12. Fused alkali and alkali chlorides in the presence of air at 1000° C. or above (see I. A. 5).
13. Lead and bismuth oxides above 1250° C.

CLEANING PLATINUM

(Reprinted by permission of the Baker Platinum Works, Newark, N. J.

Every careful analyst of necessity uses clean utensils. The habit of cleaning and polishing platinum ware immediately after using is easily formed, and repays the user with increased confidence in his work as well as with the prolonged life of the article.

The loosening effect of the Bunsen flame upon the surface of platinum exposed to its action produces the familiar gray appearance which cannot be removed except by burnishing. Rubbing the surface of platinum with moist sea sand (round grains only), applied with the finger, serves to remove most impurities and to polish the metal, without material loss in weight.

Fusing bisulphate of potash or borax in the vessel and then boiling in water and polishing as above with sand is recommended by Gmelin. When it is desired to clean the outer surface of vessels in this manner, they must be placed in dishes of sufficient size to allow the fused flux to envelope completely the article to be cleaned.

Sodium amalgam possesses the property of wetting platinum without amalgamating with it, even when other metals are purposely added to the amalgam. This substance is, therefore, useful for effecting a quick and thorough cleansing of platinum. The amalgam is gently rubbed upon the metal with a cloth and then moistened with water, which oxidizes the sodium and leaves the mercury free to alloy with foreign metals. The mercury is then wiped off and the article cleaned and polished with sand, as above described.

If the existence of a base metal alloyed with the platinum is suspected, immerse the article in question first in boiling HCl for a few minutes; then, after thoroughly rinsing with clean water, in boiling HNO_3 free from chlorine. If the article is unaffected in weight or appearance, and the acid baths fail to give reaction for base metals, the absence of such is assured.

CLEANING MIXTURES FOR CHEMICAL GLASSWARE AND PORCELAIN

The commonly employed chromic acid cleaning mixture which may be used repeatedly until the crystals have disappeared and the solution assumes a greenish tinge, is prepared by adding with the usual precautions 800 cc of crude (technical grade), concentrated sulfuric acid to a solution made by dissolving 92 grams of technical grade sodium dichromate dihydrate in 458 cc of tap water. This cleaning agent is expensive and hazardous and should only be used properly. It is relatively ineffective cold or diluted with much water. The separation of a considerable excess of red crystals of chromic acid is normal but does not interfere with the efficiency of the cleaning mixture. It should be used warm to hot but should not be excessively over-heated for long periods of time since this destroys it. This cleaning solution should never be employed as the first method of cleansing a piece of glassware unless the contamination is nothing more than in the thinnest kind of film. One of the best and most economical methods of preliminary cleansing, and often the only one necessary with even excessively dirty and oily glassware, is soaking for a brief period or preferably overnight in a moderately strong, boiling solution of Dreft, Duponol, or other similar detergent. To prevent dilution, wet glassware should be well drained before immersing in either hot or cold solutions of dichromate cleaning solution. Sodium dichromate, the active material in the solution, leaves as by-products sodium sulfate and chromic sulfate which gradually accumulate and make the mixture worthless. If heat has been applied to hasten the cleansing action or to evaporate any water which has been absorbed, the chromic sulfate sometimes adheres so firmly to the apparatus which is being cleaned that it can only be removed with difficulty. When the cleaning solution has turned green or is excessively diluted and no longer useful it should be discarded rather than left to stand around. Since it is very strongly acid it should not be poured into drains without following it with large quantities of cold, flowing water.

A soap mixture which effectively cleans glassware in a minimum of time and which works effectively in cold water is prepared as follows. Take a 10 ounce cake of a good grade of cleaning and polishing grit cake soap, such as "Bon Ami" and pulverize it to a powder with a mortar and pestle. Cut a 12 oz. cake of a good grade of rosin laundry soap, such as "Octagon," into thin slices and add just enough water to cover the mass. Slowly heat on a hot plate until the soap has dissolved in the water and a clear solution results. Add this liquid soap mixture to the powdered grit cake in a beaker or earthen jar, stirring the mixture well. Allow to stand over night or until the resulting mixture has solidified into a soft mass. This mixture can then be applied to the wet glassware in the usual manner with a brush or the hands, scrubbing thoroughly and finally rinsing in running water. It is only necessary to add small quantities of water from time to time to keep the mixture at the proper consistency.

MARKING OF GLASS AND PORCELAIN VESSELS.

Temporary marks may be made on glass or porcelain by writing with a graphite pencil on a ground or sand-blasted portion. Glassware is often

furnished with a small sandblasted label for such markings, but often the sandblasting is so poorly done that a legible result is difficult to produce. By the use of a discarded piece of alundum ware, a good ground surface is easily made on glass or porcelain; the edge of the alundum is wetted with water and rubbed with short firm strokes at the place desired. Surfaces so ground take pencil more readily than a sandblasted label and the mark is more readily erased with a rubber eraser when desired. Even porcelain crucibles thus marked may be ignited and the mark survive several ignitions but ink is better for this purpose. Ground surfaces thus produced have not been found to increase liability to breakage on heating.

Permanent identification marks, superior to those often written with wax pencils, may be made on laboratory porcelain ware, such as crucibles, evaporating dishes, etc., with ordinary blue black ink, using a pen as a marker. The surface to be marked is wiped dry and the desired characters made conveniently with a fountain pen, using sufficient ink to give a continuous opaque film. After allowing the ink to dry, the surface is gradually ignited over a Meeker burner, finally bringing the flame to bear directly upon the configurations until fused into the surface or glaze. A successful marking is reddish brown, smooth, homogeneous, and without any appearance of external roughness. It has been recommended that a trace of platinum chloride be added to the ink used in marking.

Porcelain and silica ware may be marked with platinum. About one decigram of scrap platinum is dissolved in aqua regia in a small porcelain crucible and the solution evaporated to dryness. About 1 ml of lavender oil is added and the mixture stirred until permanently mixed. The ware to be marked is warmed slightly and the mixture applied with a rubber stamp or thinly painted on with a fine brush, sharpened match, or something of the kind. The ware is then gently heated to burn off the oil and strongly ignited to fuse the metal into the surface, producing a distinct black mark. If applied too thickly the characters may be blurred, or may be a metallic mirror less distinct than the black deposit. If the marking ink becomes gummy after long keeping, it may be thinned with a little more of the oil.

REMOVAL OF MARKINGS FROM LABORATORY PORCELAIN

It is often desirable to change the old markings on porcelain beakers or evaporating dishes. A method for removing such markings consists merely of washing the old marks with hydrofluoric acid solution and washing the excess acid off as soon as the mark is removed. The hydrofluoric acid is easily applied with a rubber policeman on the end of a glass stirring rod. The acid attacks the markings before it does the porcelain, but if the acid is left on longer than necessary to remove the marks, the porcelain may become etched. The same process may be used to make a surface on new porcelain so that it will take ink easily and not allow the ink to run in burning.

LABORATORY CEMENTS*

Litharge-glycerol cement is prepared by adding sufficient litharge to a mixture of six parts commercial 95% glycerol (glycerine) with one to three parts of water to form a paste of the desired consistency. Inert materials such as iron oxide, sand, or Fuller's earth are often added to retard the setting time and to prevent cracking. This cement is fairly acid resistant.

A cement useful on porcelain, metals or stoneware is made by soaking casein in an equal weight of water for two hours during which time the casein swells but does not dissolve. At the end of this time, sodium silicate and lime are stirred in and the cement is ready for use.

BLACK ACID PROOF STAIN FOR WOOD

Kiskadden (*The Chemist-Analyst, Vol. 20, No. 3, P. 17, 1931*) gives the following formula for an acid proof stain for wood. Solution No. 1: Iron sulfate 4 parts, copper sulfate 4 parts, potassium permanganate 9 parts, and water 83 parts. Solution No. 2: Aniline 12 parts, hydrochloric acid 18 parts, and water

* For laboratory adhesives, see Brooke, J. Chem. Ed., 31, 541 (1954).

70 parts. Apply two coats of No. 1; the second coat being applied as soon as the first has dried. Rub off the excess of the last coat when dry and apply two coats of No. 2. Dry thoroughly and apply a coat of linseed oil using a cloth. The color develops into an ebony black in a few hours. The surface may be washed with soap and water. One hundred cc of No. 1 will cover approximately 20 sq. ft. of surface; 50 cc of No. 2 will cover approximately 20 sq. ft. of surface.

According to the U. S. Bureau of Chemistry the same results are obtained by an application of the following two solutions. No. 1: Copper sulfate 125 grams and potassium chlorate 125 grams are dissolved in 1000 cc of water. No. 2: Aniline hydrochloride 60 grams and hydrochloric acid (sp. gr. 1.20) 90 cc are dissolved in 500 cc of water. Application: Paint the wood first with solution No. 1 and as soon as it dries sufficiently, apply a coat of solution No. 2; allow to dry for several hours. Wash with hot water and repeat the operations until the color is a dark green. Finish by rubbing with raw linseed oil until a jet black surface is obtained.

DRESSING WAX FOR ALBERENE DESK TOPS

Melt 450 grams of paraffin on a water bath, cool to 60°C., add 340 cc of kerosine with constant stirring, and then add 340 cc of gasoline.

HEAT FILTERS

Either of the following two solutions may be employed to prevent heat rays from passing, and permit light rays to pass through. They are used in glass cells being placed between the source of artificial light and other parts of the optical apparatus. Solution No. 1: copper sulfate 0.5 grams, water 100 cc, and sulfuric acid 1 drop. Solution No. 2: ferrous ammonium sulfate 20 grams, water 100 cc, and sulfuric acid sufficient to clear the solution or about 5 drops. These solutions are stable for about two weeks.

ELECTRICAL POLARITY INDICATORS

Strips of filter paper are cut and then immersed in a solution of sodium chloride containing a few drops of phenolphthalein indicator; the strips thus prepared are then dried. When ready for use, they are moistened with water and the terminal wires are touched to the paper strips. A pink coloration appears at the point of contact with the negative terminal.

PRESERVATIVE FOR ALGAE, etc.

King's fluid for the preservation of algae consists of the following mixture: 50 grams of distilled water, 0.5 grams of glacial acetic acid, 0.2 grams of copper nitrate crystals, 0.2 grams of copper chloride crystals, and 50 grams of camphor water prepared by allowing a lump of camphor to stand in distilled water for a few days.

PURIFICATION OF MERCURY

The purest mercury is obtained by multiple vacuum distillation. The reader is referred to a method by Booth and Jones in the *Jour. Ind. Eng. Chem.*, 19, 104 (1927). For many laboratory uses the following method will yield a material of sufficient purity. If the mercury is very dirty an initial purification can be made by squeezing it through the pores in a piece of clean chamois skin. Mercury is placed in a glass filtering flask (1000 ml flask for 5 to 10 pounds of mercury) equipped with a one-hole stopper through which passes a glass tube leading nearly to the bottom of the flask. The mercury is covered with a layer of diluted nitric acid (25 volumes of concentrated, white nitric acid diluted with water to make 100 volumes of total mixture). Air is then bubbled slowly through the mixture by attaching the side outlet of the suction flask to a filter pump (water aspirator type). This method of sucking air through the mixture is an especially convenient arrangement for those laboratories not having a supply of compressed air; it also automatically eliminates the unpleasant and hazardous acid and mercury fumes which otherwise would be thrown out into the work area.

FORMULAS AND PROPERTIES OF DENATURED ALCOHOLS

The data given in the tables on denatured alcohols have been compiled from: (1) *REGULATIONS No. 3* as amended, and (2) the *APPENDIX TO REGULATIONS No. 3*, Bureau of Internal Revenue, U. S. Treasury Department, both of which may be obtained from the Superintendent of Documents, Washington, D. C. at a cost of 75¢ and 10¢ (the latter now out of print), respectively. Additional information as to the procedure to be followed and assistance in filing applications for permits to procure specially denatured alcohol can be obtained from the manufacturers of alcohol and who also assist alcohol users in the selection of a formula most suitable to their needs.

Because of its use in beverages, nearly every country has considered alcohol a proper article for taxation and government control. The tax on alcohol is usually high so that the cost of pure alcohol is far above the cost of actual manufacture. In the United States of America, alcohol which has not been denatured is subject to the Internal Revenue Tax except to certain classes of users. See definition of tax-free alcohol which follows.

Alcohol which is intended for industrial purposes is not subject to the high tax but, to make possible the removal from taxation, it is necessary to render the alcohol unfit for beverage purposes. See definitions of completely and specially denatured alcohols which follow. In the following tables, the formulas, their numbers, and authorized uses, are set by the United States Government. They are the only ones that can be used by manufacturers in the United States. These are changed from time to time but at no set interval. The Government can make changes at will either for the benefit of the manufacturers of new products or for the protection of the revenue.

The values in the tables, giving specific gravity and weight per gallon of the denatured alcohols prepared from 190 proof alcohol, are those determined by the U. S. Bureau of Standards. The specific gravity is "true specific gravity"; *i.e.*, all weighings are corrected for the buoyancy of the air. It was necessary, therefore, to change these values to "apparent specific gravity" before they could be multiplied by the weight of a gallon of water at 15.6°C to give the weight of a gallon of alcohol at the same temperature. The magnitude of this correction to specific gravity is as follows:

True specific gravity at 15.6°/15.6°C	Correction	Apparent specific gravity at 15.6°/15.6°C
0.70	−0.00035	0.69965
0.80	−0.00023	0.79977
0.90	−0.00012	0.89988

DEFINITIONS

Absolute alcohol is an alcoholic liquor containing 99.75% to 100% by volume of ethyl alcohol and is 200 proof.

Anhydrous denatured alcohol refers to denatured alcohol made with absolute alcohol. Therefore, it is anhydrous or practically free from water.

Tax-free alcohol is ethyl alcohol which may be withdrawn under permit from a bonded warehouse by: (1) the several States and Territories, or municipal subdivisions thereof, or the District of Columbia and must be used solely for mechanical and scientific purposes or for hospitals and clinics; (2) hospitals, sanitariums, or clinics operated for charity and not for profit and must be used only for medicinal, mechanical and scientific purposes, and in the treatment of patients; (3) scientific universities and colleges of learning, and must be used only for scientific, mechanical, and medicinal purposes; (4) laboratories for use exclusively in scientific research.

Tax-paid alcohol is subject to a Federal tax (in the year 1956, $10.50 a proof gallon which is at the rate of $19.95 per wine gallon of 190 proof alcohol, or $21.00 per wine gallon of 200 proof alcohol). Tax-paid alcohol may be purchased by manufacturers and others for non-beverage purposes without a Federal bond or permit. Most States have special regulations governing its purchase and use.

Completely denatured alcohol is ethyl alcohol to which have been added such denaturing materials (see following tables) as render the alcohol unfit for use as an

intoxicating beverage and of such a nature that after denaturation it may be sold and used within certain limitations, covered by Government regulations, without permit or bond. Dealers in and manufacturers using it (but not recovering for re-use) are not required to obtain a permit under Government regulations. Manufacturers using completely denatured alcohol and recovering the same for re-use must file bond and procure a permit. Dealers and manufacturers receiving, storing, selling or using as much as 11 drums or barrels (550 wine gallons) in a calendar month must keep prescribed records of the receipt, storage and disposition of such completely denatured alcohol.

Specially denatured alcohol is ethyl alcohol that has been so denatured that it can be used in specified arts and industries (see following tables) where it is not practical to use completely denatured alcohol. Specially denatured alcohol may be procured and used, free of tax, for manufacturing purposes under permits. Application for permit is required to be filed with the Assistant Regional Commissioner, Alcohol and Tobacco Tax Division, of the district in which applicant is resident. Blank forms and instructions relative to the proper execution thereof may be obtained by applying to the Assistant Regional Commissioner's office. Records of the receipt, storage and disposition of specially denatured alcohol must be kept. Samples of specially denatured alcohol may be procured by manufacturers holding permits to use specially denatured alcohol and by applicants or prospective applicants for such permits. Application for withdrawal of samples of specially denatured alcohol in excess of 8 fluid ounces must be made to the Assistant Regional Commissioner of the applicant's district. Samples of 8 fluid ounces or less may be procured by permittees and applicants or prospective applicants for permits without the necessity of filing application and procuring permit therefor.

Alcohol proof is a term expressing the alcoholic content, and is twice the percentage by volume of alcohol; *e.g.*, 190 proof is 95% by volume.

Apparent proof of a denatured alcohol is the same as the proof of pure alcohol having the same gravity as the denatured one.

Proof gallon is one gallon (231 cubic inches at 60°F; 3785.4 milliliters at 15.56°C) of alcohol-water solution containing 50% by volume of alcohol.

Proof spirits (100 Proof) is an alcoholic liquor which contains one-half its volume of alcohol of a specific gravity of 0.7939 at 60°F (15.56°C) referred to water at 60°F as unity.

Wine gallon is 231 cubic inches (3785.4 milliliters) of alcohol of any proof. A wine gallon of 190 proof alcohol is equal to 1.90 proof gallons.

Tax gallon of alcohol is one gallon of 100 proof alcohol. A gallon of spirits is taxed according to the quantity of alcohol it contains, or according to proof. One wine gallon of 190 proof alcohol is taxed as 1.90 proof gallons.

(Continued on following page.)

FORMULAS FOR SPECIALLY DENATURED ALCOHOL

Formula Number	Composition: Giving amounts of denaturant to be added to 100 gallons of 190° proof ethyl alcohol	Properties of Finished Formula: At 15.6°C — Wt. in lbs./gal.	At 15.6°C — Apparent Proof	Sp. gr. in vac. 15.6°/15.6°C	% Ethyl Alcohol — by vol.	% Ethyl Alcohol — by wt.
1	5 gal. approved wood alcohol (*a*)	6.785	190.6	0.8149	90.48	86.31
2A	2 gal. approved wood alcohol (*a*) and 2 gal. benzene	6.805	189.3	0.8173	91.35	87.45
2B	0.5 gal. benzene (*b*)	6.795	190.0	0.8161	94.53	91.75
3A	5 gal. commercially pure methyl alcohol (*a*)	6.781	190.8	0.8144	90.48	86.31
3B	1 gal. pine tar (pix liquida, U. S. P.)	6.810	189.0	0.8179	94.06	91.11
4	1 gal. of the following solution: 5 gal. of an aqueous solution containing 40% nicotine; 3 6 oz. methylene blue; water to make 100 gal.	6.823	188.2	0.8195	94.06	91.11
6A	15 gal. condensed fumes recovered in the process of manufacture of fulminate of mercury containing not less than 4 grams/100 cc of mixed aldehydes calculated as acetaldehyde	.....	.....	.....	.....	.....
6B	0.5 gal. pyridine bases	6.801	189.5	0.8169	94.53	91.75
12A	5 gal. benzene	6.820	188.3	0.8192	90.48	86.31
13A	10 gal. ethyl ether	6.740	193.3	0.8095	86.36	81.10
17	0.05 gal. (6.4 fluid oz.) animal oil (Dippel's oil)	6.795	190.0	0.8161	94.95	92.35
18	100 gal. vinegar containing not less than 9% acetic acid	7.802	97.2	0.9369	47.50	41.25
19	100 gal. ethyl ether	6.468	200.0	0.7769	47.50	48.80

22	10 gal. formaldehyde solution containing 37% formaldehyde	7.037	173.3	0.8451	86.36	84.02
23A	10 gal. acetone, U. S. P.	6.788	190.3	0.8153	86.36	84.25
23E	9 lbs. oil of bitter almonds, U. S. P.; 1 lb. salicylic acid, U. S. P.	6.840	187.1	0.8215	94.04	91.08

(*a*) Approved wood alcohol is wood spirit containing ketones, aldehydes, unsaturated compounds, etc., that render separation very difficult. In order to be approved the wood alcohol must pass general tests for the impurities and must be a wood distillation product. It is for this reason that all uses of Formula 3A are conditional.

(*b*) This formula must be used in a closed and continuous process unless it is shown that it is not practical to do so.

35A	5 gals. ethyl acetate	6 821	188.3	0.8193	90.48	86.31
36	3 gals. concentrated ammonia water, U. S. P.	6.837	187.3	0.8211	92.23	88.61
37	45 oz. eucalyptol, U. S. P.; 30 oz. thymol, U. S. P.; 20 oz. menthol, U. S. P.	6.794	190.0	0.8160	94.43	91.62
37A	5 lbs. menthol, U. S. P.; 10 lbs. camphor, U. S. P.	6.814	188.7	0.8184	93.56	90.42
38	5 gal. of a water solution of 60 oz. zinc chloride, U. S. P.; and 10 lbs. of any one of the following: (1) methyl salicylate, U. S. P.; (2) oil of wintergreen, U. S. P.; (3) oil of cassia, U. S. P.; (4) oil of cloves, U. S. P.; (5) oil of peppermint, U. S. P.	6.970	178.0	0.8371	89.94	85.62
38A	5 oz. menthol, U. S. P.; 9 oz. emetine hydrochloride, U. S. P.; 16 lbs. benzoic acid, U. S. P.	6.853	186.2	0.8231	93.38	90.18

(g) This formula is restricted to processes where the alcohol loses its identity as alcohol by being converted into other chemicals. Where it is desired to use any chemicals other than acetaldehyde or an alcoholic solution of acetaldehyde for Formula 29, the use of such chemicals shall be subject to approval by the Commissioner as to kind and amount required.

FORMULAS FOR SPECIALLY DENATURED ALCOHOL

Formula Number	Composition: Giving amounts of denaturant to be added to 100 gallons of 190° proof ethyl alcohol	Properties of Finished Formula: At 15.6°C: Wt. in lbs./gal.	At 15.6°C: Apparent Proof	Sp. gr. in vac. 15.6°/15.6°C	% Ethyl Alcohol: by vol.	% Ethyl Alcohol: by wt.
38B	A total of 10 lbs. of a mixture of two or more of the U. S. P. oils and substances listed below (*h*): Anethol N. F.; balsam tolu; benzaldehyde; camphor; chlorothymol; cinnamic aldehyde N. F.; coal tar; eucalyptol; eugenol; guaiacol; menthol crystals; methyl salicylate; phenol; phenyl salicylate; safrol with a sp. gr. not less than 1.096 and not more than 1.110 at 16°C; storax; styorax; thymol; and oils of: anise; bay; bergamot; bitter almonds; cassia or cinnamon; cedar leaf; citronella; cloves; eucalyptus; lavender; mustard (volatile); peppermint; pine or pine needles; rosemary; sassafras; spearmint; spike lavender; thyme; turpentine; wintergreen. (*h*)	6.804	189.4	0.8172	94.04	91.08
38C	160 oz. menthol, U. S. P.; 125 gal. formaldehyde solution containing 37% formaldehyde	6.832	187.7	0.8206	93.22	89.97
38D	40 oz. menthol, U. S. P.; 2.5 gal. formaldehyde solution containing 37% formaldehyde	6.863	185.7	0.8242	93.14	89.85
38E	5 gal. fluid extract ipecac, U. S. P., or 40 lbs. ipecac, U. S. P.	6.924	181.3	0.8316	90.48	86.31
39	9 lbs. sodium salicylate or salicylic acid, U. S. P.; 1.25 gal. fluid extract of quassia, N. F.; ⅛ gal. denaturing grade of tertiary butyl alcohol	6.867	185.3	0.8247	93.33	90.08
39A	60 oz. of any one of the following U. S. P. alkaloids or salts: (1) quinine; (2) quinine bisulfate; (3) quinine hydrochloride; (4) cinchonidine; (5) cinchonidine sulfate; and ⅛ gal. denaturing grade of tertiary butyl alcohol	6.810	189.0	0.8179	94.64	91.92

(*h*) Anyone desiring to use this formula must specify in the application which substances from the list are selected to make up the 10 lbs. of denaturants required. Anyone desiring to use 10 lbs. of only one of the denaturants must request the privilege from the Department setting out the denaturant and the reasons for the particular request so that the matter may be taken under advisement. Upon application the substitution of other essential oils or substances for those listed will be given consideration provided they are efficient denaturants and it is conclusively shown that none of the denaturants listed or any combinations thereof are satisfactory for the manufacture of any particular product.

FORMULAS FOR SPECIALLY DENATURED ALCOHOL

Formula Number	Composition: Giving amounts of denaturant to be added to 100 gallons of 190° proof ethyl alcohol	Properties of Finished Formula: At 15.6°C: Wt. in lbs./gal.	At 15.6°C: Apparent Proof	Sp. gr. in vac. 15.6°/15.6°C	% Ethyl Alcohol: by vol.	% Ethyl Alcohol: by wt.
39B	2.5 gal. diethyl phthalate and ⅛ gal. denaturing grade of tertiary butyl alcohol	6.857	186.0	0.8236	92.57	89.07
39C	1 gal. diethyl phthalate (*i*)	6.824	188.1	0.8196	94.06	91.11
39D	1 gal. oil of bay, N. F., and (1) 50 oz. quinine sulfate or quinine bisulfate, U. S. P., or (2) 200 oz. avoir. sodium salicylate, U. S. P.	6.819	188.4	0.8190	93.92	90.92
40	3 oz. of the alkaloid brucine or brucine sulfate; ⅛ gal. denaturing grade of tertiary butyl alcohol	6.795	190.0	0.8161	94.90	92.28
40A	5 lbs. sucrose octa acetate; ⅛ gal. denaturing grade of tertiary butyl alcohol	6.815	188.1	0.8185	94.44	91.64
42	80 grams potassium iodide, U. S. P. and 109 grams red mercuric iodide, U. S. P.; or 95 grams sodium ethyl mercuric thiosalicylate, C. P.; or 76 grams of any one of the following chemicals: (1) phenyl mercuric nitrate, C. P.; (2) phenyl mercuric chloride, C. P.; (3) phenyl mercuric benzoate, C. P.	6.797	189.8	0.8164	94.96	92.36
44	10 gal. normal butyl alcohol	6.790	190.3	0.8155	86.36	81.10
45	300 lbs. of white or orange shellac, arsenic and rosin free	7.545	126.5	0.9061	71.55	64.11
46	25 fluid oz. phenol, U. S. P.; 4 fluid oz. oil of wintergreen or methyl salicylate, U. S. P. (*j*)	6.805	189.3	0.8173	94.82	92.17
47	7 gal. fluid extract arnica flowers, N. F. (4th edition)	6.882	184.3	0.8265	88.79	84.14

(*i*) The diethyl phthalate shall be of the same quality as that specified for use in specially denatured alcohol Formula No. 39B. This formula may be used only in the manufacture of high-grade perfumes, toilet waters, and toilet-preparations containing not less than 2% by weight of essential oils, or their equivalent in perfume materials. The Department will permit the use of this formula only by manufacturers who are properly equipped by reasons of experience and manufacturing facilities to effectively control their manufacturing operations in accordance with the limitations governing the use of this formula.

(*j*) This formula will be authorized only for use by institutions and organizations which are of a semi-public character and engaged in charitable work.

FORMULAS FOR COMPLETELY DENATURED ALCOHOL

Formula Number	Composition: Giving amounts of denaturant to be added to 100 gallons of ethyl alcohol of not less than 160° proof	Properties of Finished Formula: At 15.6°C: Wt. in lbs./gal.	At 15.6°C: Apparent Proof	Sp. gr. in vac. 15.6°/15.6°C	% Ethyl Alcohol: by vol.	% Ethyl Alcohol: by wt.
18	2.5 gal. methyl isobutyl ketone, 0.125 gal. Pyronate† or a compound similar thereto, 0.5 gal. acetaldol (hydroxybutyraldehyde), 1.0 gal. kerosene	*ca* 6.8	*ca* 190	*ca* 0.817	*ca* 89	*ca* 87
19	4.0 gal. methyl isobutyl ketone, 1.0 gal. kerosene	*ca* 6.8	*ca* 190	*ca* 0.817	*ca* 89	*ca* 87

† Pyronate is a product of the destructive distillation of hardwood meeting the following requirements: Color not darker than the color produced by 2.0 g of potassium dichromate in a liter of water; acidity not over 0.1% as acetic acid (bromothymol blue end-point); boiling range, 100 ml distilled according to ASTM method for lacquer solvent (D-268–49), with not more than 5 ml boiling below 70°C, not less than 50 ml below 160°C, and not less than 90 ml below 205°C.

AUTHORIZED USES OF SPECIALLY DENATURED ALCOHOL FORMULAS

In the Manufacture of:	Formula No.
Acetic acid	18, 29, 35A
Adhesives and binders	1, 3A, 13A, 22, 23A, 30
Alcohol rubbing compounds	23G, 23H
Aldehydes	1, 2B, 13A, 24, 29
Alkaloids and medicinal chemicals	1, 2B, 3A, 12A, 13A, 17, 23A, 30, 35A
Antifreeze, proprietary	1
Antiseptic solutions	37, 36B
Bath salts	1, 3A, 3B, 23A, 31A, 38B, 39, 39A, 39B, 40, 40A
Bay rum	23A, 37, 38B, 39, 39A, 39B, 39D, 40, 40A
Brake fluid	1, 3A
Candy glazes	23A, 35, 35A, 45
Cellulose compound lacquers, etc.	1, 2A, 3A, 13A, 23A, 30
Cellulose dehydration, see Dehydration	
Cellulose intermediates	1, 3A, 13A, 19, 23A, 32
Cellulose plastics	1, 2A, 2B, 3A, 12A, 13A, 23A, 30
Chemical products, various	1, 2B, 3A, 12A, 13A, 23A, 30
Chemicals, various	1, 2B, 3A, 6B, 12A, 13A, 17, 29, 30, 32
Chloroform	20
Cleaning preparations	1, 2A, 3A, 12A, 23A, 23G, 23H, 30, 32, 37
Cleaning purposes	1, 2A, 2B, 13A, 23A, 23G, 23H, 30, 32, 37
Collodion	13A, 19, 32
Cutting oils	1, 3A
Dehydration, cellulose	1, 2B, 12A
Dehydration, sodium hydrosulfite	1, 2B, 12A

DIMENSIONAL FORMULAS

Dimensional formulas show the relation of various physical quantities and their units in terms of the fundamental quantities of mass, length, and time. In these equations l = length; m = mass; t = time; θ = angle; ω = solid angle; T = temperature; ψ = luminous flux; ϵ = dielectric constant; μ = magnetic permeability; and v = volume = l^3. In the electrostatic, or *cgse*, system: l = cm.; m = g.; t = mean solar second; T = absolute degree Centigrade; and ϵ = dielectric constant of a vacuum. In the electromagnetic, or *cgsm*, system ϵ is replaced by μ, magnetic permeability.

Absorptivity; coefficient of absorption $[l^{-1}]$
Acceleration $[lt^{-2}]$
Acceleration, angular $[\theta\, t^{-2}]$
Action $[ml^2t^{-1}]$
Angle $[\theta]$
Angle, solid $[\omega]$
Area $[l^2]$
Brightness, surface $[\psi\, l^{-2}\, \omega^{-1}]$
Bulk modulus, *cf.* stress.
Capacity, electrical $[\epsilon l]$; $[\mu^{-1}\, l^{-1}t^2]$
Charge $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}]$
Compressibility $[m^{-1}lt^2]$
Compression, modulus of, *cf.* stress.
Concentration, mass, *cf.* mass concentration.
Concentration, volume, *cf.* density.
Conductivity, electrical mass $[\epsilon\, m^{-1}l^3t^{-1}]$; $[\mu^{-1}m^{-1}lt]$
Conductivity, thermal, *cf.* thermal conductivity.
Conductivity, volume $[\epsilon l^{-1}]$; $[\mu^{-1}l^{-2}l]$
Current, electrical $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$
Density $[ml^{-3}]$ or $[mv^{-1}]$
Dielectric constant $[\epsilon]$; $[\mu^{-1}l^{-2}t^2]$
Dielectric strength $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{-\frac{1}{2}}t^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$
Diffusion, coefficient of $[l^2t^{-1}]$
Displacement, total electric, *cf.* charge.
Electrical current, *cf.* current, electrical.
Electric displacement, total, *cf.* charge.
Electrical inductivity $[\epsilon]$; $[\mu^{-1}l^{-2}t^2]$
Electrical potential, *cf.* potential, electrical.
Electrical quantity, *cf.* charge.
Energy $[ml^2t^{-2}]$
Ettinghausen effect, coefficient of $[\epsilon^{-1}m^{-1}l^{-1}t^4T]$; $[\mu m^{-1}lt^2T]$
Field intensity, magnetic, *cf.* magnetic field intensity.
Field strength, electrical, *cf.* dielectric strength.
Fluidity $[m^{-1}lt]$
Flux of induction, *cf.* charge.
Flux, luminous, *cf.* luminous flux.
Flux of magnetic induction; magnetic flux $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$
Force $[mlt^{-2}]$
Force, magnetizing, *cf.* magnetizing force.

DIMENSIONAL FORMULAS (Continued)

Force, magnetomotive, *cf.* magnetomotive force.
Force, moment of, *cf.* torque.
Frequency $[t^{-1}]$
Friction, coefficient of skin, *cf.* skin friction, coefficient of.
Hall effect, coefficient of $[\epsilon^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{1}{2}}t^{3}]$; $[\mu^{\frac{1}{2}}m^{-\frac{1}{2}}l^{\frac{1}{2}}]$
Heat, *cf.* energy.
Illumination of a surface $[\psi l^{-2}]$
Inductance, electrical $[\epsilon^{-1}l^{-1}t^{2}]$; $[\mu l]$
Induction, flux of, *cf.* charge.
Induction, magnetic, *cf.* magnetic induction.
Inductivity, *cf.* electrical inductivity.
Intensity, luminous, *cf.* luminous intensity.
Intensity of magnetization, *cf.* magnetic induction.
Intensity of radiation, *cf.* radiation, intensity of.
Ionic mobility $[\epsilon^{\frac{1}{2}}m^{-\frac{1}{2}}l^{\frac{1}{2}}]$; $[\mu^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{\frac{1}{2}}t]$
Kinematic viscosity, *cf.* viscosity, kinematic.
Leduc effect, coefficient of $[\epsilon^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{1}{2}}t^{2}]$; $[\mu^{\frac{1}{2}}m^{-\frac{1}{2}}l^{\frac{1}{2}}t]$
Length $[l]$
Luminous flux $[\psi]$
Luminous intensity of a source in a given direction $[\psi\omega^{-1}]$
Magnetic field intensity $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{-\frac{1}{2}}t^{-1}]$
Magnetic flux, *cf.* flux of magnetic induction.
Magnetic induction $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{-\frac{1}{2}}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{-\frac{1}{2}}t^{-1}]$
Magnetic induction, flux of, *cf.* flux of magnetic induction.
Magnetic permeability $[\mu]$; $[\epsilon^{-1}l^{-2}t^{2}]$
Magnetic potential, *cf.* magnetomotive potential.
Magnetic potential gradient, *cf.* magnetic field intensity.
Magnetic reluctance $[\epsilon l t^{-2}]$; $[\mu^{-1}l^{-1}]$
Magnetism, quantity of, *cf.* flux of magnetic induction.
Magnetizing force, *cf.* magnetic field intensity.
Magnetomotive force $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$
Mass $[m]$
Mass concentration $[m_1m_2^{-1}]$ (where $m_1 = m_2$, is called titer or is denoted as per cent).
Mass conductivity, electrical, *cf.* conductivity, electrical mass.
Mass resistivity, electrical, *cf.* resistivity, electrical mass.
Mobility, ionic, *cf.* ionic mobility.
Modulus, bulk, *cf.* stress.
Modulus of compression, *cf.* stress.
Modulus of rigidity, *cf.* stress.
Modulus, Young's, *cf.* stress.
Moment of a force, *cf.* torque.
Nernst effect, coefficient of $[\epsilon^{-1}lT^{-1}]$; $[\mu l^{2}t^{-1}T^{-1}]$
Peltier coefficient $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$
Per cent, *cf.* mass concentration.
Permeability, *cf.* magnetic permeability.
Piezoelectric constant $[\epsilon^{\frac{1}{2}}m^{-\frac{1}{2}}l^{\frac{1}{2}}t]$; $[\mu^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{1}{2}}t^{2}]$
Pole strength, *cf.* flux of magnetic induction.

Potential, electrical $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$
Potential gradient, *cf.* dielectric strength.
Potential gradient, magnetic, *cf.* magnetic potential gradient.
Potential, magnetic, *cf.* magnetomotive potential.
Power $[ml^2t^{-3}]$
Power, thermoelectric, *cf.* thermoelectric power.
Pressure, *cf.* stress.
Quantity, electrical, *cf.* charge.
Quantity of magnetism, *cf.* flux of magnetic induction.
Radiation, intensity of $[mt^{-3}]$ or $[ml^{-1}t^{-2}]$
Reluctance, magnetic, *cf.* magnetic reluctance.
Resistance, electrical $[\epsilon^{-1}l^{-1}t]$; $[\mu lt^{-1}]$
Resistance, electrical volume $[\epsilon^{-1}lt]$; $[\mu l^2t^{-1}]$
Resistivity, electrical mass $[\epsilon^{-1}ml^{-3}t]$; $[\mu ml^{-1}t^{-1}]$
Resistivity, surface, *cf.* resistance, electrical.
Rigidity, modulus of, *cf.* stress.
Rotatory power $[\theta l^{-1}]$
Skin friction, coefficient of $[ml^{-1}t^{-2}]$
Solubility (non-gaseous), *cf.* density.
Specific heat of electricity, *cf.* Thomson effect, coefficient of.
Strength, dielectric, *cf.* dielectric strength.
Strength, electrical field, *cf.* dielectric strength.
Strength, pole, *cf.* flux of magnetic induction.
Stress $[ml^{-1}t^{-2}]$
Surface brightness, *cf.* brightness, surface.
Surface resistivity, *cf.* resistance, electrical.
Surface tension $[mt^{-2}]$
Susceptibility, electrical $[\mu]$; $[\epsilon^{-1}l^{-2}t^2]$
Temperature $[T]$
Tension, *cf.* stress.
Tension, surface, *cf.* surface tension.
Thermal conductivity $[mlt^{-3}T^{-1}]$
Thermoelectric power $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}T^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}T^{-1}]$
Thomson effect, coefficient of $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}T^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}T^{-1}]$
Time $[t]$
Titer, *cf.* mass concentration.
Torque $[ml^2t^{-2}]$
Twist, *cf.* rotatory power.
Velocity $[lt^{-1}]$
Velocity, angular $[\theta t^{-1}]$
Velocity of a process $[t^{-1}]$
Verdet's constant $[\epsilon^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{1}{2}}t^{2\theta}]$; $[\mu^{\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{1}{2}}t^{\theta}]$
Viscosity $[ml^{-1}t^{-1}]$; viscosity, kinematic $[l^2t^{-1}]$
Volume $[l^3]$; $[v]$; volume concentration, *cf.* density.
Volume conductivity, *cf.* conductivity, volume.
Volume resistance, electrical, *cf.* resistance, electrical volume.
Work, *cf.* energy.
Young's modulus, *cf.* stress.

FUNDAMENTAL CONSTANTS FOR PHYSICAL CHEMISTRY*

Status as of July 1, 1951, by Rossini, Gucker, Johnston, Pauling and Vinal; *J. Am. Chem. Soc.* 74, 2699 (1952). All electrical units are absolute unless otherwise indicated.

Volume of ideal gas (0°, A_0)	$PV = V_0$	= 22414.6 cm³·atmos/mole
		= 2271.16 ± 0.04 joules/mole
Gas constant	R	= 82.0567 (cm³·atmos)/(deg·mole)
		= 0.0820544 (liter·atmos)/(deg·mole)
		= 1.98719 cal/(deg·mole)
		= 8.31439 ± 0.00034 joules/(deg·mole)
Ice-point†	T_0	= 273.160 ± 0.010°K
Velocity of light	c	= (2.997902 ± 0.000013) × 10^{10} cm/sec
Avogadro number	N	= (6.02380 ± 0.00016) × 10^{23} molecules/g-mole
Faraday constant	$\mathfrak{F}$	= 96493.1 ± 1.0 coulombs/g-equiv
Electronic charge	$e = \mathfrak{F}/N$	= (1.601864 ± 0.000036) × 10^{-19} coulomb
		= 1.601864 × 10^{-20} emu
		= 4.80223 × 10^{-10} esu
Planck constant	h	= (6.62377 ± 0.00027) × 10^{-27} erg·sec/molecule
Boltzmann constant	$k = R/N$	= (1.380257 ± 0.000067) × 10^{-16} erg/deg·molecule
Einstein constant relating mass and energy	$Y = c_2$	= (8.987416 ± 0.000081) × 10^{13} joules/g
Constant relating wave number and energy	$Z = Nhc$	= 11.96171 ± 0.00026 joules·cm/mole
Second radiation constant	$hc/k = c_2$	= 1.438676 ± 0.000091 cm·deg
One ampere		= 1.000165 ± 0.000025 international amperes (NBS)
One coulomb		= 1.000165 ± 0.000025 international coulombs (NBS)
One joule		= 0.999835 ± 0.000052 international joule (NBS)
One liter		= 1000.028 ± 0.004 cm³
One ohm		= 0.999505 ± 0.000015 international ohm (NBS)
One second (mean solar)		= 1.00273791 sidereal seconds
One volt		= 0.999670 ± 0.000029 international volt (NBS)
One watt		= 0.999835 ± 0.000052 international watt (NBS)

By definition:

Standard gravity	g_0	= 980.665 cm/sec²
Standard atmosphere	A_0	= 1013250 dynes/cm²
Standard millimeter of pressure	mm Hg	= 1/760 atmos
Calorie (thermochemical)	cal	= 4.1840 joules (exact)
		= 4.18331 international joules
		= 41.2929 cm³·atmos
		= 0.0412917 liter·atmos

* See also the section in this Handbook on "Probable Values of the Physical Constants."
† Triple point of water is 0.0100°C, or 273.170 ± 0.010°K.

PROBABLE VALUES OF THE PHYSICAL CONSTANTS

The values here given, supplied by Jesse W. M. DuMond and E. Richard Cohen, were taken from various authorities referred to by reference numbers in parentheses preceding each datum and listed in the Table of References at the end of this section.

The values given in Tables A-1 and A-2 are recommended for use as best representing the consensus of their 1955 information. The quantities of Table A-1 are results obtained by direct measurement with no further subsequent adjustment. These values have not been treated as "unknowns," i.e. variables subject to least squares adjustment. The values of Table A-2 are the final results obtained after two least squares adjustments by Jesse W. M. DuMond and E. Richard Cohen (*1*, 2), one published in 1953, referred to here as DC 53, the other in 1955 (DC 55). The objective of the first adjustment was to obtain that set of values of five primary unknowns, α (Sommerfeld's fine structure constant), c (the velocity of light), e (the electronic charge), N (Avogadro's number), and Λ (λ_g/λ_s), the conversion constant from Siegbahn x-units to milliangstroms), most nearly consistent with thirteen recent high precision physical measurements of eight different types of functions of these unknowns under the criterion of least squares. The external inconsistency of the thirteen input data, though small in an absolute sense, turned out to be 2.55 times as great as the a-priori estimated errors of the input data should lead one to expect. An analysis of variance of the data by digital computer indicated four of the data as possible sources of the trouble and a re-examination together with some later research has revealed physically sufficient reasons for rejection of these data. This variance analysis together with a complete re-analysis of the remaining data in terms of four variables, α, e, N and Λ has been published in 1955. The inclusion of c as an unknown was shown to be unnecessary from the results of the 1953 analysis.

The input data of the 1955 adjustment consists of seven high precision determinations of seven different types of functions of the four stated unknowns. The values given in Table A-2 are based on the results of this 1955 adjustment combined, where required, with the auxiliary data of Table A-1. The input data for both least squares adjustments, 1953 and 1955, are given in Table B. The seven input data of the 1955 adjustment inevitably form an overdetermined and (slightly) mutually inconsistent set. They are therefore *not recommended* for use as they stand. The inconsistency of the input data of the 1955 adjustment is however very satisfactorily small, the measure of external consistency of the least squares adjustment being only 1.04 times the measure of internal consistency.

Unless specified to the contrary, all quantities in these tables that involve the mole or the gram equivalent are on the physical scale of atomic weights. This is indicated by the abbreviation, *psaw*. On this scale the atomic weight of the O^{16} isotope of oxygen is by definition exactly 16. This is the only scale whose definition is at present completely unambiguous. The chemical scale of atomic weights, *csaw*, defines the average atomic weight of a mixture of all the oxygen isotopes "in their naturally occurring abundance ratios" as exactly 16. Recent precision mass-spectroscopic work by Nier and others however has established beyond doubt that there is no one "naturally occurring" abundance ratio for the oxygen isotopes. The O^{18} content of the oxygen in iron ore or water may be as much as 4 percent (of that content) lower than that taken from the atmosphere or from limestone. Raymond T. Birge has given the conversion factor $r = 1.000272 \pm 0.000005$ as the ratio of physical to chemical scales based on the assumed abundance ratio, $O^{16}:O^{18}:O^{17} = (506 \pm 10):1:(0.204 \pm 0.008)$. On the basis of the abundance ratio for atmospheric oxygen Nier has revised this scale ratio to $r = 1.000278$. Nier states that if the abundance ratio assumed were that found in iron ore or water, the conversion factor would however be $r = 1.000268$. References: R. T. Birge, *Reports on Progress in Physics (British)* **VIII**, 90 (1942); A. O. Nier, *Phys. Rev.* 77, 792 (1950). The International Commission on Atomic Weights is at present considering the arbitrary redefinition of the chemical scale of atomic weights in terms of the physical scale and the value $r = 1.000275$. In calculation of these tables the value $r = 1.000272$ was adopted. The accuracy ascribed this adopted value is such that the two numbers do not differ significantly. The effect of this difference on all of these output data is wholly negligible relative to the standard errors assigned to those data.

Throughout these tables all electrical quantities are given in absolute cgs units.

PROBABLE VALUES OF THE PHYSICAL CONSTANTS

Since 1948 the National Bureau of Standards has adopted these units for certifying their electrical standards and the older International Units are now abolished.

Rossini (*3*) recommends definition of the thermochemical calorie at *exactly* 4.1840 joules. This is to be distinguished then from the older 15° calorie defined in terms of the heat capacity of water at 15°C. The best experimental data as analyzed by Raymond T. Birge, *Rev. Mod. Phys.* 13, 233 (1941) yields the relation 1 $cal_{15^\circ C}$ = 1.00034 ± 0.00010 cal, where *cal* without the subscript refers to the "thermochemical calorie" of Rossini. In the following tables use has been made of the slightly revised value of the $cal_{15^\circ C}$ and of the conversion factor just given to express these quantities in terms of the new definition of the Kelvin scale of temperature adopted by the Tenth General Conference on Weights and Measures, October 1954, when it was decided "to define the thermodynamic scale of temperature by means of the triple point of water as a fixed fundamental point by assigning to it the temperature 273.16° Kelvin exactly." This yields a new thermodynamic scale of temperature numerically slightly different from the earlier one such that the best value of the ice point is 273.1500 ± 0.0002° K instead of 273.16 ± 0.01° K as formerly. Throughout these tables the unit of temperature is the degree Kelvin of this new 1954 definition.

TABLE A-1. QUANTITIES OBTAINED BY DIRECT MEASUREMENT WITHOUT LEAST-SQUARES ADJUSTMENT

(These are recommended values.)

(*10, 11*)	Velocity of light	c	=	$299793 \pm 0.3\ km \cdot sec^{-1}$
(*4*)	Gravitation constant	G	=	$(6.670 \pm 0.005) \times 10^{-8}\ dyne \cdot cm^2 \cdot g^{-2}$
(*3*)	Liter (= 1000 ml)	l	=	$1000.028 \pm 0.004\ cm^3$
(*5, 3*)	Volume of ideal gas (0°C, A_0)	V_0	=	$(22.4146 \pm 0.0006) \times 10^3\ cm^3 \cdot atmos \cdot mole^{-1}$ (csaw)
		V_0'	=	22.4140 ± 0.0006 liter·atmos·$mole^{-1}$ (csaw)
		V_0	=	$(22.4207 \pm 0.0006) \times 10^3\ cm^3 \cdot atmos \cdot mole^{-1}$ (psaw)
		V_0'	=	22.4201 ± 0.0006 liter·atmos·$mole^{-1}$ (psaw)
(*3*)	Gas constant	R_0	=	$(8.31696 \pm 0.00034) \times 10^7\ erg \cdot mole^{-1} \cdot deg^{-1}$ (psaw)
			=	$1.98780 \pm 0.00009\ cal \cdot deg^{-1} \cdot mole^{-1}$ (psaw)
			=	$1.98709 \pm 0.00021\ cal_{15} \cdot deg^{-1} \cdot mole^{-1}$ (psaw)
	(In terms of Standard Atmos.)		=	$82.0821 \pm 0.0034\ cm^3 \cdot atmos \cdot deg^{-1} \cdot mole^{-1}$ (psaw)
	(In terms of Standard Atmos.)		=	0.0820798 ± 0.0000034 liter·atmos·$deg^{-1} \cdot mol^{-1}$ (psaw)
(*3*)	Standard atmosphere (Definition)	A_0	=	$1013250.00\ dyne \cdot cm^{-2} \cdot atmos^{-1}$
(*5, 3*)	45° Atmosphere (Calculated)	A_{45}	=	$1013199 \pm 4\ dyne \cdot cm^{-2} \cdot atmos^{-1}$
(*5, 3*)	Ice-point (Absolute scale)	T_0	=	$273.1500 \pm 0.0002°K$
(*3*)	Triple point of water (Definition)	T_t	=	273.16°K exactly
(*3*)	Joule equivalent (Definition)	J	=	4.1840 joules per "thermochemical calorie"
(*5*)	Joule equivalent (15° calorie)	J_{15}	=	4.1855 ± 0.0004 joules per 15° calorie

(*2*) Atomic weights (psaw) of various atoms derived by measuring Q-values from nuclear reactions are listed below. This is the most accurate method at present known. The symbol and the mass number of each isotope are given. Hydrogen in its naturally occuring abundance ratio has a mean atomic weight of 1.008299 ± 0.000003 (psaw)

deuteron	Md,		=	2.014186 ± 0.000006
electron	Nm,		=	$(5.48763 \pm 0.00006) \times 10^{-4}$
neutron	Mn,		=	1.008982 ± 0.000003
proton	Mp,		=	1.007593 ± 0.000003
hydrogen	H,	1	=	1.008142 ± 0.000003
deuterium	H,	2	=	2.014735 ± 0.000006
tritium	H,	3	=	3.016997 ± 0.000011
helium	He,	3	=	3.016977 ± 0.000011
	He,	4	=	4.003873 ± 0.000015
	He,	6	=	6.020474 ± 0.000027
lithium	Li,	6	=	6.017021 ± 0.000022
	Li,	7	=	7.018223 ± 0.000026
	Li,	8	=	8.025018 ± 0.000030
beryllium	Be,	7	=	7.019150 ± 0.000026
	Be,	8	=	8.007850 ± 0.000029
	Be,	9	=	9.015043 ± 0.000030
	Be,	10	=	10.016711 ± 0.000028
boron	B,	9	=	9.016190 ± 0.000031
	B,	10	=	10.016114 ± 0.000028
	B,	11	=	11.012789 ± 0.000023
	B,	12	=	12.018162 ± 0.000022

PROBABLE VALUES OF THE PHYSICAL CONSTANTS

carbon	C, 11	=	11.014916	± 0.000024
	C, 12	=	12.003804	± 0.000017
	C, 13	=	13.007473	± 0.000014
	C, 14	=	14.007682	± 0.000011
nitrogen	N, 13	=	13.009858	± 0.000014
	N, 14	=	14.007515	± 0.000011
	N, 15	=	15.004863	± 0.000012
oxygen	O, 15	=	15.007768	± 0.000013
	O, 16	=	16.000000 (standard)	
	O, 17	=	17.004533	± 0.000007
fluorine	F, 17	=	17.007486	± 0.000011
	F, 19	=	19.004456	± 0.000015
	F, 20	=	20.006352	± 0.000019

(*S*)	Rydberg wave number for infinite mass ... R_∞	=	109737.309	± 0.012 cm^{-1}
(*S*)	Rydberg wave numbers for light nuclei..... R_H	=	109677.576	± 0.012 cm^{-1}
	R_D	=	109707.419	± 0.012 cm^{-1}
	R_{He^3}	=	109717.345	± 0.012 cm^{-1}
	R_{He^4}	=	109722.267	± 0.012 cm^{-1}

TABLE A-2. QUANTITIES OBTAINED BY LEAST SQUARES ADJUSTMENT

(These are recommended values as of 1955.)

The quantity following the ± sign is the "standard error." In the present 1955 adjustment, unlike that of DC 53, there is no significant difference between the scales of error by internal and by external consistency. Attention is called to the fact that the quantities in this table are *observationally correlated* so that in the computation of the error measures of derived values dependent on two or more of the values in this table the method explained in Ref. 1, DC 53, Sections 4 and 10 must be used. The elements of the error matrix to be used in such computations are given at the end of this table.

(*I*)	Avogadro number (psaw) . N	=	(6.02486 ± 0.00016) × 10^{23} molecules·g-mole^{-1}	
(*I*)	Loschmidt number (0°C, A_0) (psaw) ..... $n_0 = L_0 = N/V_0$	=	(2.68719 ± 0.00010) × 10^{19} cm^{-3}	
(*I*)	Electronic charge. e	=	(4.80286 ± 0.00009) × 10^{-10} esu	
	$e' = e/c$	=	(1.60206 ± 0.00003) × 10^{-20} emu	
(*I*)	Electron rest-mass.. . . . m_0	=	(9.1083 ± 0.0003) × 10^{-28} g	
(*I*)	Proton rest-mass . $m_p = M_p/N$	=	(1.67239 ± 0.00004) × 10^{-24} g	
(*I*)	Neutron rest-mass . $m_n = n/N$	=	(1.67470 ± 0.00004) × 10^{-24} g	
(*I*)	Planck constant... . . . h	=	(6.62517 ± 0.00023) × 10^{-27} erg·sec	
	$\hbar = h/2\pi$	=	(1.05443 ± 0.00004) × 10^{-27} erg·sec	
(*I*)	Conversion factor from Siegbahn x-units to milliangstroms .. $\lambda_g/\lambda_s = \Lambda$	=	1.002039 ± 0.000014	
(*I*)	Faraday constant (psaw). $\mathfrak{F} = F = Ne$	=	(2.89366 ± 0.00003) × 10^{14} esu·g-equiv^{-1}	
	$F' = F/c = Ne/c = Ne'$	=	9652.19 ± 0.11 emu·g-equiv^{-1}	
(*I*)	Charge-to-mass ratio of the electron e/m	=	(5.27305 ± 0.00007) × 10^{17} esu·g^{-1}	
	$e'/m = e/(mc)$	=	(1.75890 ± 0.00002) × 10^{7} emu·g^{-1}	
(*I*)	Ratio of h/e... . . . . h/e	=	(1.37942 ± 0.00002) × 10^{-17} erg·sec·esu^{-1}	
(*I*)	Fine structure constant..... $\alpha = e^2 2\pi/(hc) = e^2/(\hbar c)$	=	(7.29729 ± 0.00003) × 10^{-3}	
	$1/\alpha$	=	137.0373 ± 0.0006	
	$\alpha/2\pi$	=	(1.161398 ± 0.000005) × 10^{-3}	
	α^2	=	(5.32504 ± 0.00005) × 10^{-5}	
	$1 - (1 - \alpha^2)^{\frac{1}{2}}$	=	(0.266252 ± 0.000002) × 10^{-4}	
(*I*)	Ratio of mass of hydrogen to mass of proton*..... H/H$^+$	=	$[1 - (Nm/\mathrm{H})(1 - \frac{1}{2}\alpha^2)]^{-1}$	
		=	1.000544613 ± 0.000000006	
(*I*)	Ratio of mass of deuterium to mass of deuteront..... D/M_d	=	1.00027244	
(*I*)	Ratio of proton mass to electron mass..... $M_p/(Nm)$ = H$^+/Nm$	=	1836.12 ± 0.02	
(*I*)	Reduced mass of electron in hydrogen atom..... $\mu = mM_p/\mathrm{H} = m\mathrm{H}^+/\mathrm{H}$	=	(9.1034 ± 0.0003) × 10^{-28} g	

* The binding energy of the electron in the hydrogen atom has been included in the quantity. The mass of the electron when found in the hydrogen atom is not m but more correctly $m(1 - \frac{1}{2}\alpha^2 \ldots)$.

† Computed using atomic mass of electron, Nm = 0.00054875 (psaw).

PROBABLE VALUES OF THE PHYSICAL CONSTANTS

(*I*) Schrodinger constant for a fixed nucleus	$8\pi^2 m\hbar^{-2} = 2m/\hbar^2$	$(1.63836 \pm 0.00007) \times 10^{27}$ erg^{-1}·cm^{-2}
(*I*) Schrodinger constant for the hydrogen atom	$8\pi^2\mu\hbar^{-2} = 2\mu/\hbar^2$	$(1.63748 \pm 0.00007) \times 10^{27}$ erg^{-1}·cm^{-2}
(*I*) First Bohr radius	$a_0 = h^2(4\pi^2 me^2)^{-1}$	$\hbar^2/(me^2) = \alpha/(4\pi R_\infty)$ $= (5.29172 \pm 0.00002) \times 10^{-9}$ cm
(*I*) Radius of electron orbit in normal H[1], referred to center of mass	$a_0' = a_0(1 - \alpha^2)^{1/2}$	$= (5.29158 \pm 0.00002) \times 10^{-9}$ cm
(*I*) Separation of proton and electron in normal H[1]	$a_0'' = a_0' R_\infty/R_H$	$= (5.29446 \pm 0.00002) \times 10^{-9}$ cm
(*I*) Compton wave length of the electron	λ_{ec}	$= h/(mc) = \alpha^2/(2R_\infty)$ $= (24.2626 \pm 0.0002) \times 10^{-11}$ cm
	$\lambda\!\!\!^{-}_{ec} = \lambda_{ec}/(2\pi) = \alpha^2/(4\pi R_\infty)$	$= (3.86151 \pm 0.00004) \times 10^{-11}$ cm
(*I*) Compton wave length of the proton	$\lambda_{cp} = h/m_{cp}c$	$= (13.2141 \pm 0.0002) \times 10^{-14}$ cm
	$\lambda\!\!\!^{-}_{cp} = \lambda_{cp}/(2\pi)$	$= (2.10308 \pm 0.00003) \times 10^{-14}$ cm
(*I*) Compton wave length of the neutron	$\lambda_{cn} = h/m_{cn}c$	$= (13.1959 \pm 0.0002) \times 10^{-14}$ cm
	$\lambda\!\!\!^{-}_{cn} = \lambda_{cn}/(2\pi)$	$= (2.10019 \pm 0.00003) \times 10^{-14}$ cm
(*I*) Classical electron radius	$r_0 = e^2/(mc^2) = \alpha^3/(4\pi R_\infty)$	$= (2.81785 \pm 0.00004) \times 10^{-13}$ cm
	r_0^2	$= (7.94030 \pm 0.00021) \times 10^{-26}$ cm^2
(*I*) Thomson cross section	$(8/3)\pi r_0^2$	$= (6.65205 \pm 0.00018) \times 10^{-25}$ cm^2
(*I*) Fine structure doublet separation in hydrogen	ΔE_H	$= (1/16)R_H\alpha^2[1 + \alpha/\pi + (5/8 - 5.946/\pi^2)\alpha^2]$ $= 0.365871 \pm 0.000003$ cm^{-1} $= 10968.56 \pm 0.10$ Mc·sec^{-1}
(*I*) Fine structure separation in deuterium	$\Delta E_D = E_H \cdot R_D/R_H$	$= 0.365970 \pm 0.000003$ cm^{-1} $= 10971.54 \pm 0.10$ Mc·sec^{-1}
(*I*) Zeeman displacement per gauss	$(e/mc)/(4\pi c)$	$= (4.66885 \pm 0.00006) \times 10^{-5}$ cm^{-1}·gauss^{-1}
(*I*) Boltzmann constant	$k = R_0/N$	$= (1.38044 \pm 0.00007) \times 10^{-16}$ erg·deg^{-1} $= (8.6167 \pm 0.0004) \times 10^{-5}$ ev deg^{-1}

* These formulas apply only to non-relativistic velocities. If the velocity of the particle is not negligible compared to the velocity of light, c, or the energy not negligible compared to the rest-mass energy, we must use $\lambda_D = \lambda_c[\epsilon(\epsilon + 2)]^{-1/2}$ where λ_c is the appropriate Compton wave length for the particle in question and ϵ is the kinetic energy measured in units of the particle rest-mass.

Error Elements by External Consistency for 1955 Adjustment

Error matrix, $v_{ij} = \sigma_i\sigma_j r_{ij}$ (in ppm²)

	α	e	N	λ_E/λ_s
α	21.52	62 50	−60.60	17.70

TABLE B. RESUMÉ OF PRIMARY INPUT DATA OF LEAST SQUARES ADJUSTMENT

(These are not recommended values.)

The values which follow are the raw material upon which the 1953 and 1955 least squares adjustments of DuMond and Cohen were based. They are given for purposes of information only. In any least squares adjustment there is always a slight degree of inconsistency among the over-determined input data. The aim in a least squares adjustment is to make the least squares adjusted output values more representative of the entirety of the knowledge contained in the input data than any single input datum alone. It is for this reason that the items in Table B are not recommended for use.

PROBABLE VALUES OF THE PHYSICAL CONSTANTS

The user should read the introductory material preceding Table A-1 explaining the reasons for and the methods used in refining the results of the DC 53 adjustment which after rejection of certain data lead to the still more consistent DC 55 adjustment. Table B below lists the input data of both of these adjustments.

	Symbol	Name or explanation	Value
(8)	R_∞	Rydberg constant for infinite mass	109737.311 ± 0.012 cm^{-1}
(7)	$[M_p/(Nm_\mu')]\mu_e/\mu_o$	Ratio of magnetic moments of electron and proton†	658.2288 ± 0.0004
(9)	μ_e/μ_o	Correction for anomalous electron magnetic moment	μ_e/μ_o $1 + (\alpha/2\pi) - (2.973\alpha^2/\pi^2)$ 1.0011453
(10)	c	Velocity of light (microwave interferometer)	299792.6 ± 0.7 km·sec^{-1}
		Velocity of light ("geodimeter")	299793.1 ± 0.3 km·sec^{-1}
	Ne/c	Iodine faraday (psaw)	9652.15 ± 0.13 abs emu·g-$equiv^{-1}$
	Ne/c^*	Silver faraday (psaw)	9651.29 ± 0.19 abs emu·g-$equiv^{-1}$
(14)	μ'	Proton magnetic moment (inverse cyclotron) expressed in nuclear magnetons, $\mu_n = eh/(4\pi m_p c)$	2.79236 ± 0.00010 nuclear magnetons
		Proton magnetic moment (omegatron) expressed in nuclear magnetons, $\mu_n = eh/(4\pi m_p c)$	2.79268 ± 0.00003 nuclear magnetons
(15)	$\gamma = \mu' Ne/(M_p c)$	Gyromagnetic ratio of proton	(2.67523 ± 0.00006) × 10^4 sec^{-1}·$gauss^{-1}$
(16)	$\Lambda = \lambda_g/\lambda_s$	Conversion factor x-units to milliangstroms	1.002020 ± 0.000030
(17)	$hc^2/(e\Lambda)^*$	Voltage-wave length (x-units) conversion factor	12370.02 ± 0.63 emu x-unit
(18)	$hc^2/(e\Lambda)^*$	Voltage-wave length (x-units) conversion factor	12371.03 ± 0.48 emu x-unit
(19)	$hc^2/(e\Lambda)$	Voltage-wave length (x-units) conversion factor	12370.77 ± 1.03 emu x-unit
(20)	$N\Lambda^3$	Siegbahn-Avogadro number (psaw)	(6.06179 ± 0.00023) × 10^{23} molecules·g-$mole^{-1}$
(21)	ΔE_D	Fine structure separation in deuterium	(10971.59 ± 0.10) × 10^6 sec^{-1}
		$E_D = (1/16)\alpha^2 R_\infty c[1 + (5/8)\alpha^2 + (\alpha/\pi)(1 - 5.946\alpha/\pi)]M_d/D$	

† The magnetic moment of the proton referred to here is the value, μ', before correction for diamagnetism.

* For the meaning of the asterisk, see text on follow g page.

All of the data in Table B were used in the DC 53 adjustment. Data which were rejected after the variance analysis of DC 55 are indicated with an asterisk after the symbol. These were not used in the DC 55 adjustment which formed the basis for the present adjusted values.

SOURCES OF DATA, REFERENCES AND NOTES

(*1*) As indicated in the text preceding Table A-1, the adjusted values given in Table A-2 are the result of two successive least squares adjustments published as follows: Jesse W. M. DuMond and E. Richard Cohen, "Least Squares Adjustment of the Atomic Constants, 1952," *Rev. Mod. Phys.* **25**, 691 (1953) and, "Analysis of Variance of the 1952 Data on the Atomic Constants and a New Adjustment, 1955," *Rev. Mod. Phys.* **27**, 363 (1955) by E. Richard Cohen, J. W. M. DuMond, T. W. Layton and J. S. Rollett. The DC 53 adjustment had thirteen input equations in five unknowns α, c, e, N and Λ. The ratio of the measures of external and internal consistency was $r_e/r_i = 2.55$. Because of this high value all the errors of the DC 53 output data were based on the criterion of external consistency. Also for this reason a digital computer program of a form of analysis of variance was started in an effort to locate which of the thirteen input data might be the discordant ones. In this program 219 least squares adjustments were effected on subsets of the thirteen equations, the variable c first having been eleminated on evidence from the DC 53 adjustment that no

information would thus be sacrificed. It was found that by rejecting the four items indicated by an asterisk in the above list the remaining data, seven equations in the four unknowns, α, e, N and Λ, had the much improved ratio, $r_e/r_i = 1.04$, and no other set of rejections resulted as satisfactorily. Furthermore independent physical arguments show fairly clear evidence of the probable existence of systematic errors in these four data. The cited articles should be consulted for many essential details here omitted, particularly the correct method explained on pp 697, 698 and 704 of DC 53 for calculating the error measures of further data which the user may wish to derive using values taken from Table A-2. The variance-covariance matrix given at the end of Table A-2 is the one which must be used.

(*2*) Measured Q-values in nuclear reactions give the most accurate values of the masses of light atoms. C. W. Li, W. Whaling, W. A. Fowler and C. C. Lauritsen, *Phys. Rev.* **83,** 512 (1951).

(*3*) These data are partly based on reports to the National Research Council Committee on Physical Chemistry by Frederick D. Rossini, July 1, 1949 and July 1, 1951. Where necessary, values have been converted to the physical scale of atomic weights (psaw) by use of the conversion factor 1.000272 ± 0.000006.

A report on the redefinition of the Kelvin scale of temperature by the Tenth General Conference on Weights and Measures at Paris and Sevres and other actions taken there has been given by E. C. Crittenden, *Science* **120,** 1007 (1954).

It should be emphasized that the liter and the milliliter are *not* units of the cgs system, whose unit of volume is the cubic centimeter. They are units in a system in which "density of water" replaces length as a fundamental unit. On a level of sufficiently high precision however this is ambiguous unless the isotopic constitution of the water is specified. We have adopted the same value as Birge, *Reports on Progress in Physics* (*British*) **VIII,** 102 (1942) who took the value of the liter as corrected by Guillaume in 1927. We have enlarged Birge's "probable error" to express it as a "standard error" and to give slightly more latitude for the uncertainties of undefined isotopic constitution.

(*5*) "The General Physical Constants as of August 1941 with Details on the Velocity of Light Only," Raymond T. Birge, *Reports on Progress in Physics* **VIII,** 90 (1941).

(*6*) Thomas, Driscoll and Hipple, *N. B. S., R. P.* 2104, 44, June 1950; *Phys. Rev.* **78,** 787 (1950). The computed diamagnetic correction of Ramsey, *Phys. Rev.* **77,** 567 (1950) has been used to obtain γ_D.

(*7*) Koenig, Prodell and Kusch, *Phys. Rev.* **88,** 191 (1952).

(*8*) The Rydberg constant for infinite mass, R_∞, was obtained from analysis of three original sources by E. R. Cohen, *Phys. Rev.* **88,** 353 (1952) taking into consideration the modifications required by the Lamb shift. The original sources examined by Cohen are measurements by W. V. Houston; Chu; and Drinkwater, Richardson and Williams.

(*9*) The correction factor, μ_e/μ_o, for the anomalous magnetic moment of the electron can be computed with amply sufficient accuracy (error less than 0.1 ppm) by using $\alpha^{-1} = 137.04$, a value which is entirely consistent with the least squares output value of this analysis.

(*10*) The velocity of light as obtained by K. D. Froome, *Proc. Roy. Soc.* (*Ind.*) **A213,** 123 (1952) at the British National Physical Laboratory with a microwave interferometer.

(*11*) The velocity of light as obtained by E. Bergstrand, *Nature* **163,** 338 (1949); *ibid.* **165,** 405 (1950); *Arkiv Fysik* **2,** 119 (1950); *ibid.* **3,** 479 (1951) with visible light over long outdoor baselines using Kerr cell modulation with the apparatus called by him a "geodimeter."

(*12*) Electrochemical determinations of the faraday by the electrolysis of iodine and silver, G. W. Vinal and S. J. Bates, *Natl. Bur. Standards Bull.* **10,** 425 (1914); G. W. Vinal and W. M. Bouvard, *ibid.* **13,** 147 (1916). These data recomputed by G. W. Vinal, Nov. 22, 1949 and further corrected for the new atomic weight of iodine (1951) were privately communicated by J. A. Hipple, Dec. 14, 1951.

(*13*) This is the apparent magnetic moment of the proton, μ' (uncorrected for diamagnetism), expressed in nuclear magnetons, $\mu_n = eh/4\pi m_p c$, as obtained by Bloch and Jeffries using the method of cyclotron resonance with their "inverse cyclotron." F. Bloch and C. D. Jeffries, *Phys. Rev.* **80**, 305 (1950); C. D. Jeffries, *ibid.* **81**, 1040 (1951).

(*14*) The same quantity as the preceding reference as obtained by Sommer, Thomas and Hipple, *Phys. Rev.* **82**, 697 (1951) using the method of cyclotron resonance with their "omegatron."

(*15*) The gyromagnetic ratio from the proton, γ', as obtained at the National Bureau of Standards by Thomas, Driscoll and Hipple, *N. B. S. Jour. of Res.* **44**, 569 (1950); *Phys. Rev.* **78**, 787 (1950) before making the diamagnetic correction.

(*16*) The conversion factor, $\lambda_g/\lambda_s = \Lambda$, from the Siegbahn nominal scale of x-ray wave lengths (expressed in x-units) to milliangstroms as recommended for general adoption by Sir Lawrence Bragg, *Acta Cryst.* **1**, 46 (1948); *J. Sci. Instr.* **24**, 27 (1947) after consultation with Manne Siegbahn, B. E. Warren, and H. Lipson, with due consideration given to the analysis of various sources of primary data by R. T. Birge; *Am. J. Phys.* **13**, 63 (1945). Birge's data are based on independent measurements by J. A. Bearden, by Erik Bäcklin, by Martin Söderman and by F. Tyrén.

(*17*), (*18*), (*19*) Three sets of measurements of the voltage-wave length conversion factor from volts to x-units made by studies of the short wave length limit of the continuous x-ray spectrum at a variety of voltages as follows:—(*17*) G. Felt, J. Harris and J. W. M. DuMond, *Phys. Rev.* **92**, 1160 (1953), 24.5 kilovolts. (*18*) J. A. Bearden, F. T. Johnson and H. M. Watts, *Phys. Rev.* **81**, 70 (1951), 10 and 6 kilovolts. (*19*) J. A. Bearden and G. Schwarz, *Phys. Rev.* **79**, 674 (1950), 19.6, 9.8 and 8 kilovolts. These data have been analyzed in DC 55 (ref. *1*) and a systematic trend as a function of applied voltage has been revealed which probably results from the method used for locating the exact limit of the spectrum. Data taken at the lowest voltages should be the most reliable. An average of the data taken between 6 and 10 kilovolts has therefore been adopted. This happens to coinside with the results of reference *19*.

(*20*) This is the value of the Avogadro number multiplied by Λ^3 obtained by measuring the grating constant in x-units of a crystal, the geometrical factor ϕ for its unit cell, the density of the crystal and the molecular weight of its unit cell. The value used is a weighted average obtained by R. T. Birge, *Am. J. Phys.* **13**, 63 (1945) for five different crystals.

(*21*) The fine structure separation, $2^2P_{3/2} - 2^2P_{1/2}$, in deuterium measured directly in frequency units by the molecular beam method developed by Willis Lamb, Jr. and collaborators for the study of the fine and hyperfine structure of hydrogen and its isotopes; see S. Triebwasser, E. S. Dayhoff and W. Lamb, Jr., *Phys. Rev.* **89**, 98 (1953); E. S. Dayhoff, S. Triebwasser and W. Lamb, Jr., *ibid.* **89**, 106 (1953). The use of this datum rather than $\Delta\gamma_H$ the hyperfine structure shift in the $^2S_{1/2}$ state in hydrogen as measured (to 0.2 ppm) by A. G. Prodell and P. Kusch, *ibid.* **79**, 1009 (1950) constitutes the major improvement in the November 1952 least squares adjustment of DuMond and Cohen over their December 1950 adjustment. This is true in spite of the fact that the estimated experimental error in the deuterium fine structure measurement is 9 ppm as contrasted with the 0.2 ppm error in the hyperfine structure measurement. The utility of both measurements is that they yield, after certain corrective factors, a value for the quantity, $\alpha^2 cR_\infty$. The hyperfine structure measurement has the unfortunate defect that the correction factors involve a term depending on the finite spacial extension of the proton magnetic dipole, a quantity about which not enough is known to make a sufficiently accurate calculation. The fine structure measurement in deuterium, on the contrary, does not suffer from this defect. The formula ΔE_D in frequency units is

$$\Delta E_D = (1/16)\alpha^2 cR_\infty[1 + (5/8)\alpha^2 + (\alpha/\pi)(1 - 5.946\alpha/\pi)]M_d/D$$

wherein D and M_d are respectively the atomic masses of the deuterium atom and the deuteron. $D/M_D = 1.00027244$ is readily computed using Nm the atomic mass of the electron on the physical scale (psaw), $Nm = 0.00054875$.

VISCOSITY CONVERSION TABLE

Poise = c. g. s. unit of absolute viscosity. Centipoise = 0.01 poise.
Stoke = c. g. s. unit of kinematic viscosity. Centistoke = 0.01 stoke.
Centipoises = centistokes × density (at temperature under consideration).
Reyn (1 lb. sec. per sq. in.) = 69 × 10^5 centipoises.

CENTISTOKES TO SAYBOLT, REDWOOD AND ENGLER UNITS

Cf. Jour. Inst. Pet. Tech., Vol. 22, p. 21 (1936); Reports of A. S. T. M. Committee D-2, 1936 and 1937.

The values of Saybolt Universal Viscosity at 100°F and at 210°F are taken directly from the comprehensive *ASTM Viscosity Tables, Special Technical Publication No. 43A* (1953) by permission of the publishers, American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa.

Centistokes	Saybolt Universal Viscosity at			Redwood Seconds at			Engler Degrees at all Temps.
	100°F.	130°F	210°F.	70°F.	140°F.	200°F.

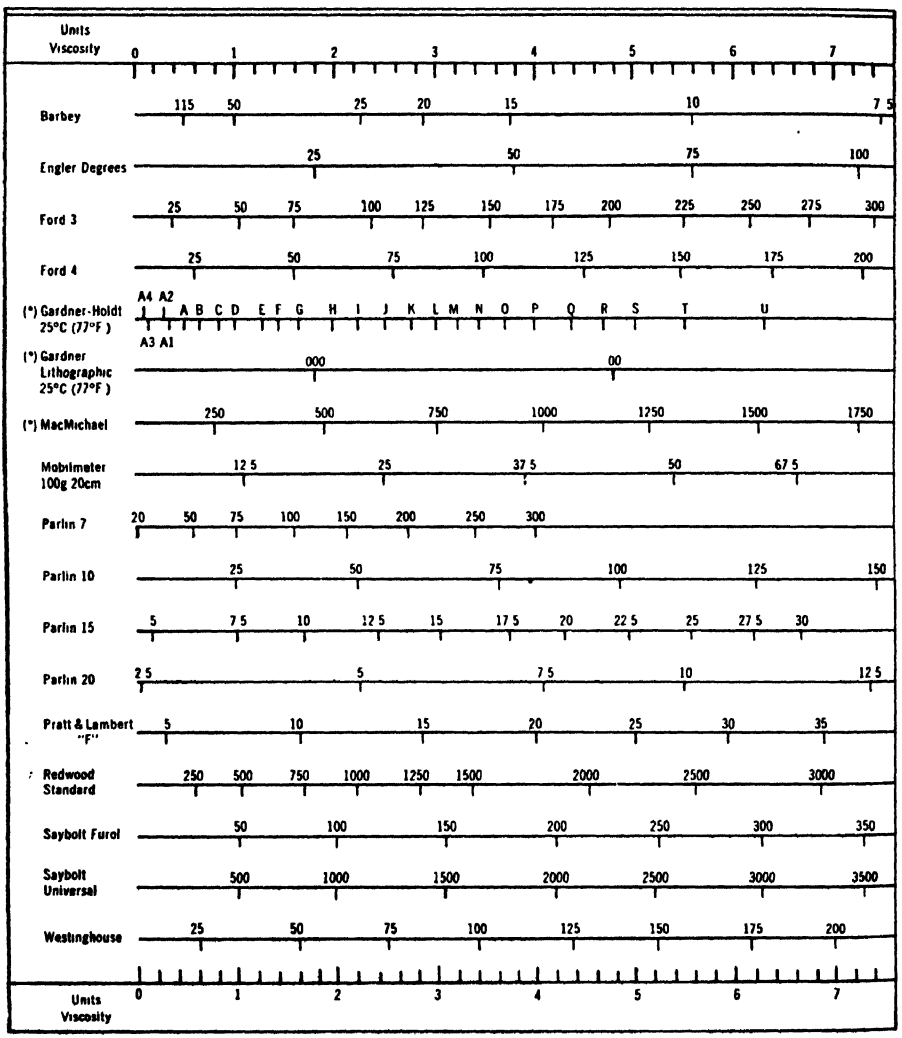
34.0	159.2	159.5	160.3	138.9	140.2	142.2	4.57
36.0	168.2	168.5	169.4	146.9	148.2	150.3	4.83
38.0	177.3	177.6	178.5	155.0	156.2	158.3	5.08
40.0	186.3	186.7	187.6	163.0	164.3	166.7	5.34
42.0	195.3	195.7	196 7	171.0	172.3	175.0	5.59
44.0	204.4	204.8	205.9	179.1	180.4	183.3	5.85
46.0	213.7	214.1	215.2	187.1	188.5	191.7	6.11
48.0	222.9	223.3	224.5	195.2	196.6	200.0	6.37
50.0	232.1	232.5	233.8	203.3	204.7	208.3	6.63
60.0	278.3	278.8	280.2	243.5	245.3	250.0	7.90
70.0	324.4	325.0	326.7	283.9	286.0	291.7	9.21
80.0	370.8	371.5	373.4	323.9	326.6	333.4	10.53
90.0	417.1	417.9	420.0	364.4	367 4	375.0	11.84
100.0*	463.5	464.4	466.7	404.9	408.2	416.7	13.16

* At higher values use the same ratio as above for 100 centistokes; *e.g.*, 102 centistokes = 102 × 4.635 Saybolt seconds at 100 F.



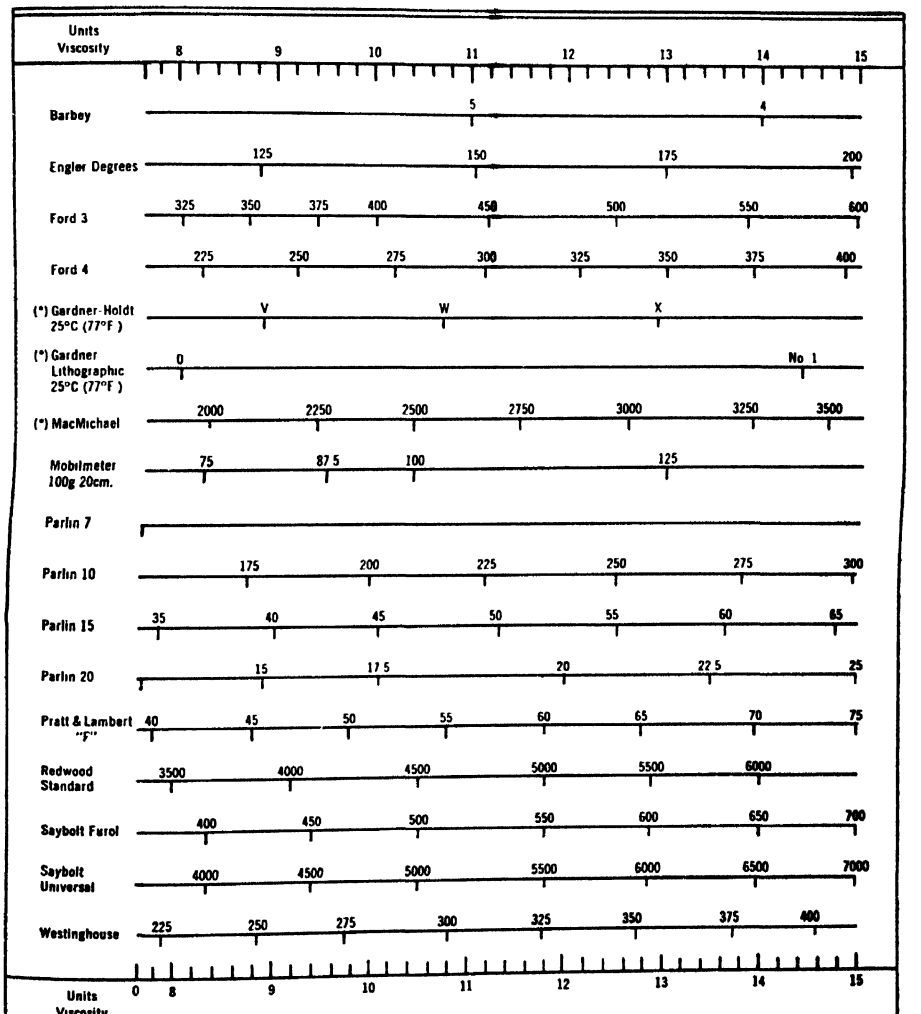
To obtain the Saybolt Universal viscosity equivalent to a kinematic viscosity determined at t°F., multiply the equivalent Saybolt Universal viscosity at 100°F. by 1 + (t − 100) 0.000064; *e.g.*, 10 centistokes at 210°F are equivalent to 58.91 × 1.0070, or 59.32 Saybolt Universal Viscosity at 210°F.

VISCOSITY COMPARISON CHART

Originally this chart was prepared by the Chemical Division of Armour & Co. as an aid in its own work where quick, approximate conversions were often more important than absolute accuracy. It is reproduced here with their permission for use under similar conditions.

A straight-edge lined up with the known viscosity reading and, to insure perpendicularity, with the top and bottom scales (Units Viscosity scale; i.e., absolute viscosity) permits approximate, corresponding readings on all other scales.

For instructions on use and for examples see following pages.



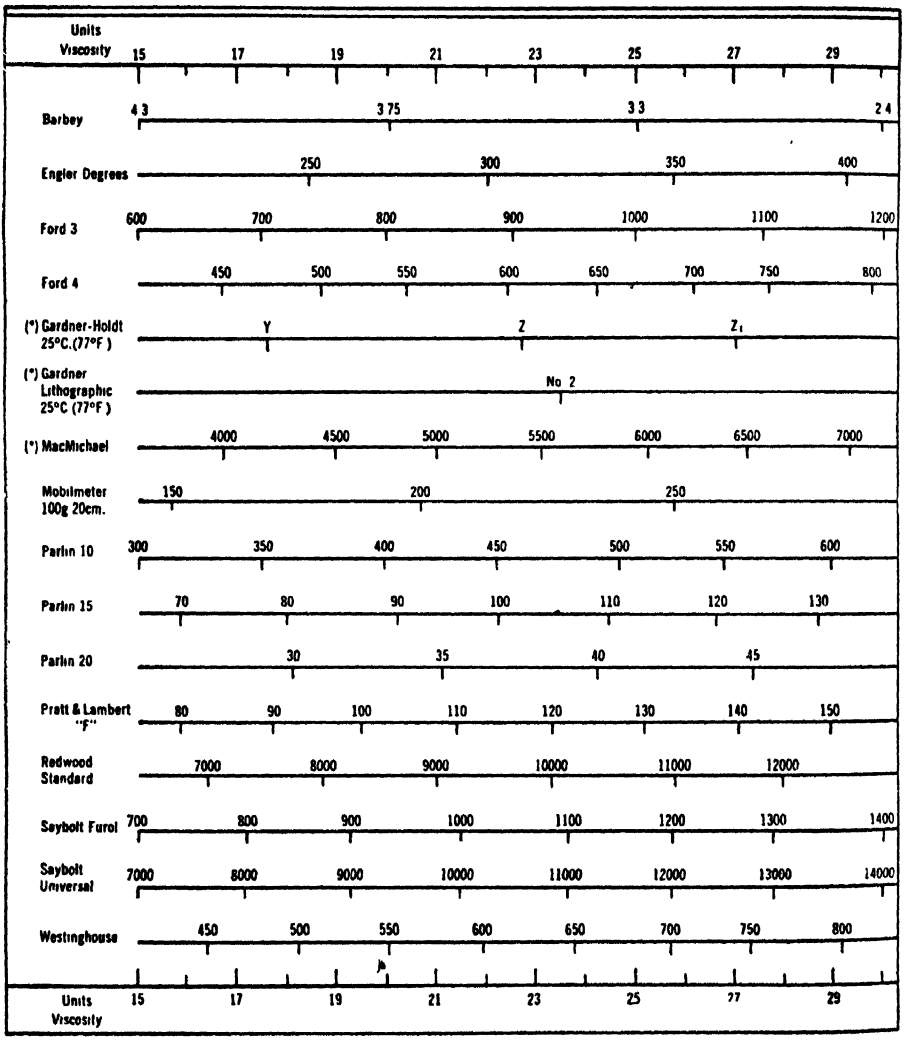
VISCOSITY COMPARISON CHART (Continued)

Instructions—Read Carefully

Scales marked with an asterisk (*) may be compared with each other or read directly to "poises" (i.e., absolute viscosity) on the top and bottom (Units Viscosity) scales. On all other scales direct conversions may be made between scales or read directly to "stokes" (i.e., kinematic viscosity) on the Units Viscosity scale (top and bottom scales).

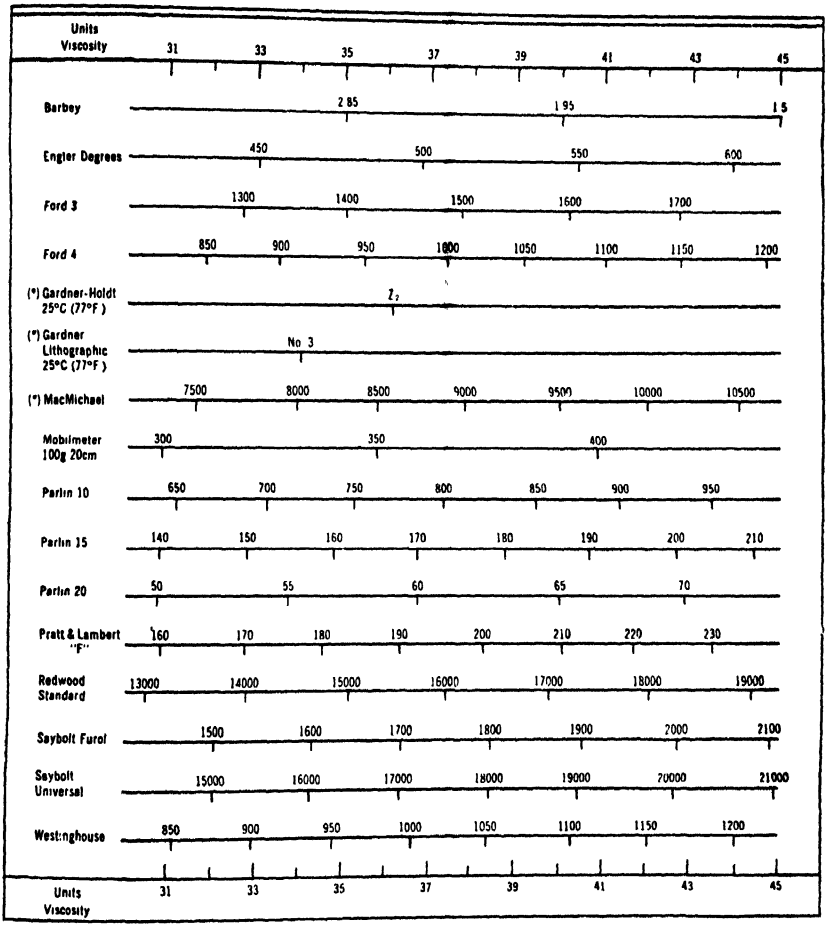
With the exception of Gardner-Holdt and Gardner Lithographic Scales comparisons are made directly at the same temperature.

For examples, see following page.



VISCOSITY COMPARISON CHART (Continued)

Examples



To convert: "Saybolt Universal, 1000 seconds at 212°F" to "Engler Degrees at 212°F". Line up straight-edge at "Saybolt Universal 1000" using top and bottom (Units Viscosity) scales to insure perpendicularity. Intersection on Engler Scale shows "27 Engler Degrees at 212°F."

To convert: "Saybolt Universal, 1000 seconds at 212°F, density 0.800" to "Gardner-Holdt at 25°C (77°F)." Line up straight-edge passing through "Saybolt Universal"

VISCOSITY COMPARISON CHART (Continued)

at 1000. Intersection of straight-edge at top and bottom scales (Units Viscosity) shows "2.0 stokes (kinematic)." Multiply stokes by density (2 × 0.800) = 1.6 poises (absolute). Line up straight-edge at "1.6" on top and bottom (Units Viscosity) scales. Intersection of straight-edge on "Gardner-Holdt" scale shows "G". That is, this material at 212°F has the same viscosity that Gardner-Holdt "G" has at 25°C.

Viscosity Poises	0	50	100	150	200
Gardner-Holdt 25°C.(77°F.)		Z_3 Z_4	Z_5	Z_6	
Gardner Lithographic 25° C. (77° F.)		No 4	No. 5		No. 6

CONVERSION OF WEIGHINGS IN AIR TO WEIGHINGS IN VACUO

If the mass of a substance in air is M_f, its density D_m, the density of weights used in making the weighing D_w, and the density* of air D_a, the true mass of the substance is vacuo, M_{vac} is

$$M_{vac} = M_f + D_a M_f \left(\frac{1}{D_m} - \frac{1}{D_w}\right)$$

For most purposes it is sufficient to assume a density of 8.4 for brass weights, and a density of 0.0012 for air under ordinary conditions. The equation then becomes

$$M_{vac} = M_f + 0.0012 M_f \left(\frac{1}{D_m} - \frac{1}{8.4}\right)$$

This table which follows gives the values of k (buoyancy reduction factor), which is the correction necessary because of the buoyant effect of the air upon the object weighed; the table is computed for air with the density of 0.0012; m is the weight in grams of the object when weighed in air; weight of object reduced to "in vacuo" $= m + \frac{km}{1000}$

Density of object weighed	Buoyancy reduction factor, k			
	Brass weights, density = 8.4	Pt or Pt-Ir weights, density = 21.5	Al or quartz weights, density = 2.7	Gold weights, density = 17

USE OF COINS AS WEIGHTS

(Approximate values for United States coins.)

One 50¢ piece = 12.5 grams = 200 grains (avoir.)
One 25¢ piece = 6.25 grams = 100 grains (avoir.)
One 10¢ piece = 2.5 grams = 40 grains (avoir.)
One 5¢ piece = 5 grams = 80 grains (avoir.)
One 1¢ piece = 3.1 grams = 50 grains (avoir.)
One 10¢ piece + two 50¢ pieces = 27.5 grams = 440 grains, or approximately one ounce; i. e. 437.5 grains.

HOUSEHOLD UNITS

(Approximate values.)

1 Pint = 2 cups = 0.47 liter
1 Cup = 16 tablespoons = 0.5 pint = 237 ml
1 Tablespoon = 3 teaspoons = 15 ml
1 Teaspoon = 4.9 ml

MOLAR EQUIVALENT OF ONE LITER OF GAS AT VARIOUS TEMPERATURES AND PRESSURES

The values in this table, which give the number of moles in one liter of gas, are based on the property of an "ideal" gas and were calculated by use of the formula:

$$\text{moles/liter} = \frac{P}{760} \times \frac{273}{T} \times \frac{1}{22.40}$$

where P is the pressure in millimeters of mercury and T is the temperature in degrees Absolute ($= t°C + 273$).

To convert to moles per cubic foot multiply the values in the table by 28.316.

Pressure mm of mercury	Temperature °C

TEMPERATURE (°C.) AND PRESSURE (760 mm Hg)

gas at 22° and 710.2 mm = 20 × 0.86475 = 17.30 ml at 0°C. and 760 mm. Weight in milligrams of 1 ml of gas at N. T. P.:—acetylene, 1.173; carbon dioxide, 1.9769; hydrogen, 0.0899; nitric oxide (NO), 1.3402; nitrogen, 1.25057; oxygen, 1.42904.

CONVERSION OF THERMOMETER SCALES

The following abbreviations are used: F, degrees Fahrenheit; C, degrees Centigrade; R, degrees Reaumur; A.K, degrees Kelvin; A.R, degrees Rankine; Z, degrees on any scale; (f. p.)"Z", the freezing point of water on the Z scale; (b. p.) "Z", the boiling point of water on the Z scale. Cf. Dodds, *Chemical and Metallurgical Engineering*, Vol. 38, p. 476 (1931).

$$\frac{F-32}{180}=\frac{C}{100}=\frac{R}{80}=\frac{A_K-273}{100}=\frac{A_R-492}{180}=\frac{Z-(f.p.)\text{"Z"}}{(b.p.)\text{"Z"}-(f.p.)\text{'Z"}}$$

Examples: (1) To find the Fahrenheit temperature corresponding to −20°C:

$$\frac{F-32}{180}=\frac{C}{100}\text{ or }\frac{F-32}{180}=\frac{-20}{100}\text{; i.e., } -20°C=-4°F$$

(2) To find the Reaumur temperature corresponding to 20°F:

$$\frac{F-32}{180}=\frac{R}{80}\text{ or }\frac{20-32}{180}=\frac{R}{80}\text{; i.e., } 20°F=-5.33°R$$

(3) To find the correct temperature on a thermometer reading 80°C and which shows a reading of −0.30°C in melting ice and 99.0°C. in steam at 760mm pressure:

$$\frac{C}{100}=\frac{Z-(f.p.)\text{"Z"}}{(b.p.)\text{"Z"}-(f.p.)\text{"Z"}}=\frac{80-(-0.30)}{99.0-(0.30)}\text{; i.e., } C=80.87°\text{ (corrected)}$$

The reading of any inaccurate thermometer can be corrected and converted in this manner into a reading on any of the other scales; thus, in the example (3) above, to convert into a Fahrenheit scale:

$$\frac{F-32}{180}=\frac{80-(-0.30)}{99\,0-(-0.30)}\text{; i.e., } F=177.56°\text{ (corrected)}$$

Centigrade to Fahrenheit

Formula: (°C×9/5)+32=°F Examples: (1) To convert 60°C to °F, (60×9/5)+32=140°F
(2) To convert −20°C to °F, (−20×9/5)+32=−4°F
(See also special table)

Centigrade to Reaumur

Formula: °C×4/5=°R Examples: (1) To convert 40°C to °R, 40×4/5=32°R
(2) To convert −30°C to °R, −30×4/5=−24°R

Centigrade to Centigrade Absolute or Kelvin

Formula: °C+273.1=°K Examples: (1) To convert 20°C to °K, 20+273.1=293.1°K
(2) To convert −20°C to °K, −20+273.1=253.1°K

Fahrenheit to Centigrade

Formula: (°F−32)×5/9=°C Examples: (1) To convert 140°F to °C, (140−32)×5/9=60°C
(2) To convert −76°F to °C, (−76−32)×5/9=−60°C
(See also special table)

Fahrenheit to Reaumur

Formula: (°F−32)×4/9=°R Examples: (1) To convert 41°F to °R, (41−32)×4/9=4°R
(2) To convert −13°F to °R, (−13−32)×4/9=−20°R

Fahrenheit to Fahrenheit Absolute or Rankine

Formula: °F+459.58=°R′ Examples: (1) To convert 20°F to °R′, 20+459.58=479.58°R′
(2) To convert −20°F to °R′, −20+459.58=439.58°R′

Reaumur to Centigrade

Formula: °R×5/4=°C Examples: (1) To convert 32°R to °C, 32×5/4=40°C
(2) To convert −24°R to °C, −24×5/4=−30°C

Reaumur to Fahrenheit

Formula: (°R×9/4)+32=°F Examples: (1) To convert 8°R to °F, (8×9/4)+32=50°F
(2) To convert −8°R to °F, (−8×9/4)+32=14°F
(3) To convert −20°R to °F, (−20×9/4)+32=−13°F

TEMPERATURE CONVERSION TABLES

The column of figures in bold and which is headed "Reading in °F. or °C. to be converted" refers to the temperature either in degrees Fahrenheit or Centigrade which it is desired to convert into the other scale. If converting from Fahrenheit degrees to Centigrade degrees the equivalent temperature will be found in the column headed "°C." while if converting from degrees Centigrade to degrees Fahrenheit, the equivalent temperature will be found in the column headed "°F." This arrangement is very similar to that of Sauveur and Boylston, copyrighted 1920 and is published with their permission.

HYDROMETER CONVERSION TABLES

This table gives the relation between density (C.G.S.) and degrees on the Baumé and Twaddell scales. The Twaddell scale is never used for densities less than unity. See also section on *Hydrometers*.

Density	Degrees Baumé Bu. Stand. Scale	Degrees Baumé A.P.I. Scale

COMPARISON OF HYDROMETER SCALES

For Liquids Lighter Than Water

See also special tables for Baumé.

Common liquids requiring lighter than water hydrometer scales are alcohol and ammonia solutions, oils (few common exceptions), paints (some are also heavier than water), solvents (except carbon tetrachloride and chloroform), varnishes (few common exceptions), wines (dry).

Approximate values are given below for hydrometers standardized at 15.56°C (60°F). If standardized at any other temperature the scale values would be different.

In the following table column headings for the various hydrometer scales are as follows: *A*, Specific gravity; *B*, British % proof (alcohol); *C*, % Alcohol by volume, Tralle, Gay-Lussac; *D*, U. S. Internal Revenue % proof spirit (alcohol); *E*, U. S. Custom House (alcohol) proof; *F*, % Alcohol by weight, Richter; *G*, Cartier; *H*, % Ammonia.

COMPARISON OF HYDROMETER SCALES

For Liquids Heavier Than Water

See also special tables for Baumé, Twadell, N. Y. Board of Health Lactometer, and Quevenne Lactometer.

Common liquids requiring heavier than water hydrometer scales are acids and acid solutions, alkali solutions, beer, bleaching solutions, cider, dye solutions, fruit juices, glues, glycerine, milk, paint (some are also lighter than water), salt solutions, sizing solutions, sugar solutions, syrups, tanning solutions, urine, vinegar, wines (sweet).

Approximate values are given below for hydrometers standardized at 15.56°C (60°F). If standardized at any other temperature the scale values would be different.

In the following table column headings for the various hydrometer scales are as follows: *A*, Specific gravity; *B*, % Sugar, Brix, Ballings, Plato; *C*, % Saturation calcium chloride (calcium); *D*, % Saturation salt, sodium chloride (Salometer); *E*, Barkometer, Urinometer, Quevenne's (lactometer) lactodensimeter.

TANK AND PIPE CAPACITIES

VERTICAL TANKS

Cf. McCrea, *News Ed., Ind. Eng. Chem. 18, 451 (1940)* by permission.

Cylindrical tanks of diameter D and depth d in inches:

(1) Gallons $= (0.00340 \times D^2) \times d$
(2) Liters $= (0.01288 \times D^2) \times d$

Rectangular tanks of base area A and depth d in inches:

(1) Gallons $= (0.00433 \times A) \times d$
(2) Liters $= (0.0164 \times A) \times d$

For any one tank the expression within the parentheses is a constant. The constant multiplied by any liquid depth gives the liquid contents. This is particularly advantageous in setting a gauge for fluctuating volumes.

HORIZONTAL CYLINDRICAL TANKS

Cf. Davis, *Chemist Analyst 25, No. 4, p. 87 (1936)* by permission.

The volume of liquid contents in a cylindrical tank resting upon its side in a horizontal position is equal to the product of the length of the tank multiplied by the area of the "wetted" portion of an end. This area is that of a segment of a circle and is $\frac{1}{2}R^2(\theta - \sin\theta)$ where θ in radians, is equal to $2\cos^{-1}[(R-d)/R]$ and where R is the radius of the circle and d is the depth of the segment as in figure 1a.

Figure 1b on the following page can be used for converting percentage diameter to percentage volume.

Example. To find the liquid contents of a cylindrical tank 6 ft., 8 in. ($6\frac{2}{3}$ ft. $= 20/3$ ft. $= 80$ in.) in diameter and 10 ft. long resting upon its side in a horizontal position with liquid contents to a depth of 24 inches.

The total volume of this tank is $\frac{1}{4}\pi(20/3)^2 \times 10 = 349$ cu. ft. The liquid depth is 24/80 or 30% of the diameter. On figure 1b, opposite 30% on the diameter scale is read 25% on the volume scale. This means that the liquid contents are 25% of 349 cu. ft. or 87.3 cu. ft.

Example. To find the depth of liquid when this same tank contains 241 cu. ft. of liquid contents.

Two hundred and forty-one cu. ft. is 241/349 or 69% of the total capacity of the tank. Reference to figure 1b shows that 69% of the volume corresponds to 65.0% of the diameter. This means that 241 cu. ft. of liquid will show a depth of 65% of 80 inches or 52.0 inches.

PIPES

Cf. Schaphorst, *News Ed., Ind. Eng. Chem. 18, 109 (1940)* by permission.

Figure 2 on the following page can be used to find the volume in U. S. gallons of any given length of all the standard pipe sizes from $\frac{1}{8}$ inch to 15 inches. In this figure, line A shows the standard pipe sizes, line B shows lengths of pipe from 0.1 to 800,000 feet, and line C shows volumes from 1 to 1000 gallons. A straight line through the pipe size on line A and through the length of pipe on line B will intersect line C at the number of gallons contained. Thus, the broken line in the figure is representative of a $2\frac{1}{2}$-inch pipe (on A) of 400 feet length (on B) which intersects C at 100 gallons, the capacity of the pipe line. In the same manner, knowing any of two other variables, the third may be found. Even values lying at points beyond the limits of the figure may be found, as for example: To determine the volume of a $\frac{1}{2}$-inch pipe 1 foot long, a straight line is run through the $\frac{1}{2}$-inch point on A and the 10,000-point on B. The intersection on C shows 160 gallons which is the capacity of a pipe 10,000 feet in length. By merely dividing this capacity by 10,000 will give 0.016 gallons as the volume of a 1 foot length.

For conversion of U. S. Gallons into other units of capacity, see special table of *Conversion Factors.*

THREE HUNDRED YEAR CALENDAR

1753 to 2052

To find the day of the week:—First find the year in the table and then in the same horizontal column to the right find the month where the number is given which refers to the corresponding column of days in the table which follows.

Example:—To find the day of the week corresponding to Armistice Day, November 11, 1918 find the year 1918 and in the horizontal column to the right under November is the figure 5 which refers to column 5 which is the calendar for November of 1918 which shows that November 11, 1918 was on Monday.

SURFACE AREAS AND VOLUMES*

Let a, b, c, d, and s denote lengths, A denote areas, and V denote volumes.

Triangle.

$A = bh/2$, where b denotes the base and h the altitude.

Rectangle.

$A = ab$, where a and b denote the lengths of the sides.

Parallelogram (opposite sides parallel).

$A = ah = ab \sin \theta$, where a and b denote the sides, h the altitude and θ the angle between the sides.

Trapezoid (four sides, two parallel).

$A = \frac{1}{2}h(a + b)$, where a and b are the sides and h the altitude.

Regular Polygon of n Sides. (Fig. 1).

$$A = \frac{1}{4} n\, a^2 \operatorname{ctn} \frac{180^\circ}{n},$$ where a is length of side.

$$R = \frac{a}{2} \csc \frac{180^\circ}{n},$$ where R is radius of circumscribed circle.

$$r = \frac{a}{2} \operatorname{ctn} \frac{180^\circ}{n},$$ where r is radius of inscribed circle.

$$\alpha = \frac{360^\circ}{n} = \frac{2\pi}{n},$$ radians,

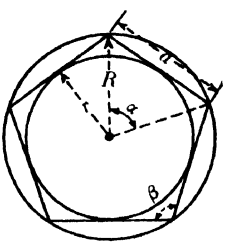

Fig. 1

$$\beta = \left(\frac{n-2}{n}\right) \cdot 180^\circ = \left(\frac{n-2}{n}\right)\pi$$ radians where α and β are the angles indicated in Fig. 1.

$$a = 2r \tan \frac{\alpha}{2} = 2R \sin \frac{\alpha}{2}.$$

Circle. (Fig. 2).

Let C = circumference,
R = radius,
D = diameter,
A = area,
S = length of arc subtended by θ,
l = chord subtended by arc S,
h = rise,
θ = central angle in radians.

* Adapted by permission from Burington, "*Handbook of Mathematical Tables and Formulas*," 3d ed., McGraw-Hill, New York (1959).

$C = 2\pi R = \pi D, \quad \pi = 3.14159\cdots.$

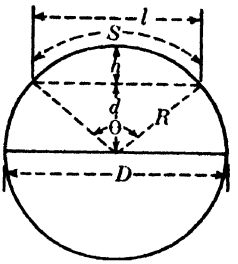

Fig. 2

$S = \mathrm{R}\theta = \tfrac{1}{2}D\theta = D\cos^{-1}\frac{d}{R}.$

$l = 2\sqrt{R^2 - d^2} = 2R\sin\frac{\theta}{2} = 2d\tan\frac{\theta}{2}.$

$d = \tfrac{1}{2}\sqrt{4R^2 - l^2} = R\cos\frac{\theta}{2} = \tfrac{1}{2}\,l\,\mathrm{ctn}\,\frac{\theta}{2}.$

$h = \mathrm{R} - d.$

$$\theta = \frac{S}{R} = \frac{2S}{D} = 2\cos^{-1}\frac{a}{R} = 2\tan^{-1}\frac{l}{2d} = 2\sin^{-1}\frac{l}{D}.$$

A (circle) $= \pi R^2 = \tfrac{1}{4}\pi D^2.$

A (sector) $= \tfrac{1}{2}Rs = \tfrac{1}{2}R^2\theta.$

A (segment) $= A$ (sector) $- A$ (triangle) $= \tfrac{1}{2}R^2(\theta - \sin\theta)$

$$= R^2\cos^{-1}\frac{(\mathrm{R}-h)}{R} - (R-h)\sqrt{2Rh-h^2}.$$

Perimeter of a n-side regular polygon inscribed in a circle

$$= 2n\,R\sin\frac{\pi}{n}.$$

Area of inscribed polygon $= \tfrac{1}{2}nR^2\sin\frac{2\pi}{n}.$

Perimeter of a n-side regular polygon circumscribed about a circle

$$= 2nR\tan\frac{\pi}{n}.$$

Area of circumscribed polygon $= nR^2\tan\frac{\pi}{n}.$

Radius of circle inscribed in a triangle of sides a, b, and c is

$$r = \sqrt{\frac{(s-a)\,(s-b)\,(s-c)}{s}}, \quad s = \tfrac{1}{2}(a+b+c).$$

Radius of circle circumscribed about a triangle is

$$R = \frac{abc}{4\sqrt{s(s-a)\,(s-b)\,(s-c)}}$$

38. Ellipse. (Fig. 3).

$A = \pi ab$, where a and b are lengths of semi-major and semi-minor axes respectively.

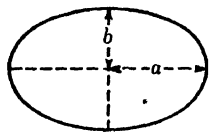

Fig. 3

39. Parabola. (Fig. 4).

$$A = 2ld/3.$$

Height of $d_1 = \frac{d}{l^2}(l^2 - l_1^2)$.

Width of $l_1 = l\sqrt{\frac{d-d_1}{d}}$.

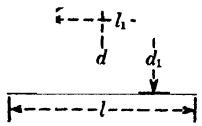

Fig. 4

$$\text{Length of arc} = l\left[1 + \frac{2}{3}\left(\frac{2d}{l}\right)^2 - \frac{2}{5}\left(\frac{2d}{l}\right)^4 + \cdots\right].$$

Area by Approximation. (Fig. 5). If $y_0, y_1, y_2, \cdots, y_n$ be the lengths of a series of equally spaced parallel chords, and if h be their distance apart, the area enclosed by boundary is given approximately by any one of the following formulae:

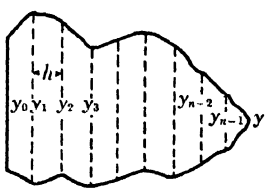

Fig. 5

$A_T = h\left[\frac{1}{2}(y_0 + y_n) + y_1 + y_2 + \cdots + y_{n-1}\right]$. (Trapezoidal Rule.)

$A_D = h\left[0.4(y_0 + y_n) + 1.1(y_1 + y_{n-1}) + y_2 + y_3 + \cdots + y_{n-2}\right]$. (Durand's Rule.)

$A_S = \frac{1}{3}h\left[(y_0 + y_n) + 4(y_1 + y_3 + \cdots + y_{n-1}) + 2(y_2 + y_4 + \cdots + y_{n-2})\right]$. ($n$ even, Simpson's Rule.)

In general, A_S gives the most accurate approximation.

The greater the value of n, the greater the accuracy of approximation.

Cube.

$V = a^3$; $a = a\sqrt{3}$; total surface area $= 6a^2$, where a is length of side and d is length of diagonal.

Rectangular Parallelopiped.

$V = abc$; $d = \sqrt{a^2 + b^2 + c^2}$; total surface area $= 2(ab + bc + ca)$, where a, b, and c are the lengths of the sides and d is length of diagonal.

Prism or Cylinder. $V =$ (area of base) · (altitude).

Lateral area = (perimeter of right section) · (lateral edge).

Pyramid or Cone. $V = \frac{1}{3}$ (area of base) · (altitude).

Lateral area of regular pyramid
$= \frac{1}{2}$ (perimeter of base) · (slant height).

Frustum of Pyramid or Cone.

$V = \frac{1}{3}(A_1 + A_2 + \sqrt{A_1 \cdot A_2})\, h$, where h is the altitude and A_1 and A_2 are the areas of the bases.

Lateral area of a regular figure
$= \frac{1}{2}$ (sum of perimeters of base) · (slant height).

Prismoid. $V = \frac{h}{6}(A_1 + A_2 + 4A_3)$, where h = altitude, A_1 and A_2 are the areas of the bases, and A_3 is the area of the midsection parallel to bases.

Area of Surface and Volume of Regular Polyhedra of edge l.

Name	Type of Surface	Area of Surface	Volume
Tetrahedron	4 equilateral triangles	$1.73205l^2$	$0.11785l^3$
Hexahedron (cube)	6 squares	$6.00000l^2$	$1.00000l^3$
Octahedron	8 equilateral triangles	$3.46410l^2$	$0.47140l^3$
Dodecahedron	12 pentagons	$20.64578l^2$	$7.66312l^3$
Icosahedron	20 equilateral triangles	$8.66025l^2$	$2.18170l^3$

Sphere. (Fig. 6).

A (sphere) $= 4\pi R^2 = \pi D^2$.

A (zone) $= 2\pi R h_1 = \pi D h_1$.

V (sphere) $= \frac{4}{3}\pi R^3 = \frac{1}{6}\pi D^3$.

V (spherical sector) $= \frac{2}{3}\pi R^2 h_1 = \frac{1}{6}\pi D^2 h_1$.

V (spherical segment of one base) $= \frac{1}{6}\pi h_3 (3r_3^2 + h_3^2)$.

V (spherical segment of two bases) $= \frac{1}{6}\pi h_2 (3r_3^2 + 3r_2^2 + h_2^2)$.

A (lune) $= 2R^2\theta$, where θ is angle in radians of lune

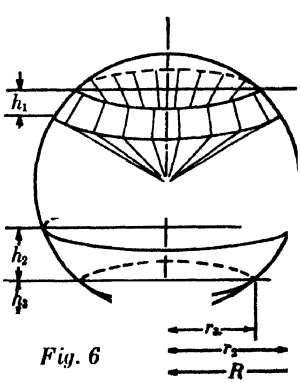

Fig. 6

Ellipsoid.

$V = \frac{4}{3}\pi abc$, where a, b, and c are the lengths of the semi-axes.

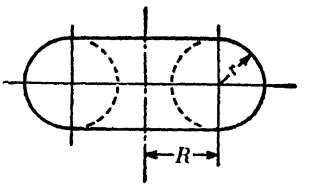

Fig. 7

Torus. (Fig. 7). $V = 2\pi^2 Rr^2$.

Area of surface $= S = 4\pi^2 Rr$.

Theorems of Pappus:

(a) If a plane area A be rotated about a line l in the plane of A and not cutting A, the volume of the solid generated is equal to the product of A and the distance traveled by the center of gravity of A.

(b) If a plane curve C be rotated about a line l in the plane of C and not cutting C, the area of the surface generated is equal to the product of the length of C and the distance traveled by the center of gravity of C.

Trigonometric Functions of an Angle α. (Fig. 8).

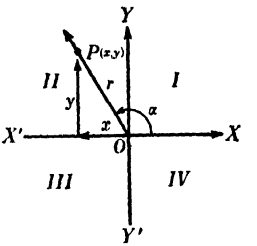

Fig. 8

Let α be any angle whose initial side lies on the positive x-axis and whose vertex is at the origin, and (x, y) be any point on the terminal side of the angle. (x is positive if measured along OX to the right, from the y-axis; and negative, if measured along OX' to the left from the y-axis. Likewise, y is positive if measured parallel to OY, and negative if measured parallel to OY'.) Let r be the positive distance from the origin to the point. The trigonometric functions of an angle are defined as follows:

sine α	=	sin α	=	$\frac{y}{r}$	.
cosine α	=	cos α	=	$\frac{x}{r}$	.
tangent α	=	tan α	=	$\frac{y}{x}$	.
cotangent α	=	ctn α = cot α	=	$\frac{x}{y}$	.
secant α	=	sec α	=	$\frac{r}{x}$	.
cosecant α	=	csc α	=	$\frac{r}{y}$	.
exsecant α	=	exsec α	=	sec $\alpha - 1$	.
versine α	=	vers α	=	$1 - \cos \alpha$	.
coversine α	=	covers α	=	$1 - \sin \alpha$	.
haversine α	=	hav α	=	$\frac{1}{2}$ vers α	.

LOGARITHMS

Properties and Uses

Definition of Logarithm. The *logarithm* x of the number N to the base b is the exponent of the power to which b must be raised to give N. That is,

$$\log_b N = x \text{ or } b^x = N.$$

The number N is positive and b may be any positive number except 1.

Properties of Logarithms.

(*a.*) *The logarithm of a product is equal to the sum of the logarithms of the factors; thus,*

$$\log_b M \cdot N = \log_b M + \log_b N.$$

(*b.*) *The logarithm of a quotient is equal to the logarithm of the numerator minus the logarithm of the denominator; thus,*

$$\log_b \frac{M}{N} = \log_b M - \log_b N.$$

(*c.*) *The logarithm of a power of a number is equal to the logarithm of the base multiplied by the exponent of the power; thus,*

$$\log_b M^p = p \cdot \log_b M.$$

(*d.*) *The logarithm of a root of a number is equal to the logarithm of the number divided by the index of the root; thus,*

$$\log_b \sqrt[q]{M} = \frac{1}{q} \log_b M.$$

Other properties of logarithms:

$$\log_b b = 1. \qquad \log_b \sqrt[q]{M^p} = \frac{p}{q} \cdot \log_b M.$$

$$\log_b 1 = 0. \qquad \log_b N = \log_a N \cdot \log_b a = \frac{\log_a N}{\log_a b}$$

$$\log_b (b^N) = N. \qquad b^{\log_b N} = N.$$

[illegible] of Logarithms. There are two common systems of logarithms in use: (1) the *natural* (Napierian or hyperbolic) system which uses the

base $e = 2.71828\ldots$; (2) the *common* (Briggsian) system which uses the base 10.

We shall use the abbreviation $\log N \equiv \log_{10} N$ in this section.

Unless otherwise stated, tables of logarithms are always tables of common logarithms.

Characteristic of a Common Logarithm of a Number. Every real positive number has a real common logarithm such that if $a < b$, $\log a < \log b$. Neither zero nor any negative number has a real logarithm.

A common logarithm, in general, consists of an integer, which is called the *characteristic*, and a decimal (usually endless) which is called the *mantissa*. The characteristic of any number may be determined from the following rules.

Rule I. *The characteristic of any number greater than* 1 *is one less than the number of digits before the decimal point.*

Rule II.† *The characteristic of a number less than* 1 *is found by subtracting from* 9 *the number of ciphers between the decimal point and the first significant digit, and writing* −10 *after the result.*

Thus the characteristic of log 936 is 2; the characteristic of log 9.36 is 0; of log 0.936 is 9 −10; of log 0.00936 is 7 −10.

Mantissa of a Common Logarithm of a Number. An important consequence of the use of base 10 is that the mantissa of a number is independent of the position of the decimal point. Thus 93,600, 93.600, 0.000936, all have the same mantissa. Hence in Tables of Common Logarithms only mantissas are given. A five place table gives the values of the mantissa correct to five places of decimals.

To Find the Logarithm of a Given Number N. By means of Rules I and II determine the characteristic. Then use the Table to find mantissa.

To find mantissa when the given number (neglecting decimal point) consists of four, or less, digits (exclusive of ciphers at the beginning or end), look in the column marked N for the first three significant digits and pick the column headed by the fourth digit—the mantissa is the number appearing at the intersection of this row and column. Thus to find the logarithm of 64030, first note (by Rule I) that the characteristic is 4. Next, in the Table, find 640 in column marked N

† Some writers use a dash over the characteristic to indicate a negative value: for example, $\log .004657 = 7.66811 - 10 = \bar{3}.66811$.

and opposite it in column 3 is the desired mantissa, .80638. Hence log 64030 = 4.80638. Likewise, log 0.0064030 = 7.80638 − 10; log 0.64030 = 9.80638 −10.

Interpolation. The mantissa of a number of more than four significant figures can be found approximately by assuming that the mantissa varies directly as the number in the small interval not tabulated. Thus if N has five digits (significant), and f is the fifth digit of N, the mantissa of N is

$$m = m_1 + \frac{f}{10}\left(m_2 - m_1\right),$$

where m_1 is the mantissa corresponding to the first four digits of N, m_2 is the next larger mantissa in the table. $(m_2 - m_1)$ is called a *tabular difference.* The proportional part of the difference $m_2 - m_1$ is called the *correction.* These proportional parts are printed without zeros at the right-hand side of each page as an aid to mental multiplications.

For example, find log 64034. Here $f = 4$. From the table we see $m_1 = .80638$, $m_2 = .80645$, whence $m = .80638 + (4/10)\ (.00007)$, log 64034 = 4 + m = 4.80641.

To Find the Number N when its Logarithm is Known. (The number N whose logarithm is k is called the *anti logarithm* of k.)

Case 1. If the mantissa m is found exactly in the Table, join the figure at the top of the column containing m to the right of the figures in the column marked N and in the same row as m, and place the decimal point according to the characteristic of the logarithm.

Case 2. If the mantissa m is not found exactly in the table, interpolate as follows: find the next smaller mantissa m_1 to m; the first four significant digits of N correspond to the mantissa m_1, and the fifth digit f equals the nearest whole number to

$$f = 10\left(\frac{m - m_1}{m_2 - m_1}\right),$$

where m_2 is the next larger mantissa to m appearing in the table. Then locate the decimal point according to the characteristic.

The decimal point may be located by means of the following rules:

Rule III. *If the characteristic of the logarithm is positive (then the mantissa is not followed by* −10*), begin at the left, count digits one more than the characteristic, and place the decimal point to the right of the last digit counted.*

Rule IV. *If the characteristic is negative (then the mantissa will be preceded by an integer n and followed by* -10*), prefix* $(9-n)$ *ciphers, and place the decimal point to the left of these ciphers.*

Illustrations of the Use of Logarithms.

Example 1. Given $\log x = 2.91089$, find x. The mantissa .91089 appears in the table. Join the figure 5 which appears at the top of the column to the right of the number 814 in the column N, giving the number 8145. By Rule III, the decimal point is placed to the right of 4, thus giving $x = 814.5$.

Example 2. Given $\log x = 2.34917$, find x. The mantissa $m = .34917$ does not appear in the table. The next smaller and next larger mantissas are m_1 and m_2,

$$m_1 = .34908, \quad m = .34917, \quad m_2 = .34928.$$

The first four digits of N, corresponding to m_1, are 2234 and the fifth digit is the nearest whole number (5) to

$$10\left(\frac{m - m_1}{m_2 - m_1}\right) = 10\left(\frac{.00009}{.00020}\right) = 4.5$$

By Rule III, we locate decimal point, thus giving $x = 223.45$.

Example 3. Find $x = (396.21)\,(.004657)\,(21.21)$.

$$\begin{aligned} \log 396.21 &= 2.59792 \\ \log .004657 &= 7.66811 - 10 \\ \log 21.210 &= \underline{1.32651} \qquad \text{(add)} \\ \log x &= 11.59257 - 10, \quad x = 39.135. \end{aligned}$$

Example 4. Find $x = \dfrac{396.21^*}{24.3}$.

$$\begin{aligned} \log 396.21 &= 2.59792 \\ \log 24.3 &= \underline{1.38561} \quad \text{(subtract)} \\ \log x &= 1.21231, \quad x = 16.305. \end{aligned}$$

Example 5. Find $x = (3.5273)^4$.

$$\begin{aligned} \log 3.5273 &= 0.54745 \\ &\qquad\qquad \underline{\quad\quad 4 \text{ (multiply)}} \\ \log x &= 2.18980, \quad x = 154.81. \end{aligned}$$

---

* Some writers use *cologarithms*. The cologarithm of a number N is the negative of the logarithm of N; i. e., $\operatorname{colog} N = 10.00000 - \log N - 10$. Adding the cologrithm is equivalent to subtracting the logarithm. Thus in our example, $\operatorname{colog} 24.3 = (10.00000 - 1.38561) - 10 = 8.61439 - 10$, and $\log 396.21 - \log 24.3 = \log 396.21 + \operatorname{colog} 24.3 = 2.59792 + 8.61439 - 10 = 11.21231 - 10 = \log 16.305$.

Example 6. Given $\log x = -2.23653$, to find x. To convert this logarithm to one with a positive mantissa, add algebraically -2.23653 to $10.00000-10$. Thus

$$\begin{array}{rl} & 10.00000-10 \\ & -2.23653 \\ \log x & = 7.76347-10, \text{ hence } x = 0.0058006. \end{array}$$

Example 7. Find $x = \sqrt[3]{.04657}$.

$$\begin{aligned} \log x &= \tfrac{1}{3} \log (.04657), \\ &= \tfrac{1}{3}(8.66811-10) = \tfrac{1}{3}(-1.33189), \\ \log x &= -0.44396 = 9.55604-10, \quad x = 0.35978. \end{aligned}$$

or

$$\begin{aligned} \log x &= \tfrac{1}{3}(8.66811-10) = \tfrac{1}{3}(28.66811-30) \\ \log x &= 9.55604-10, \quad x = 0.35978. \end{aligned}$$

Example 8. Find $x = \dfrac{1}{21.210}$.

$$\begin{aligned} \log x &= \log 1 - \log 21.210 \\ \log 1 &= 10.00000-10 \\ \log 21.210 &= 1.32654 \qquad \text{(subtract)} \\ \log x &= 8.67346-10, \; x = 0.047148. \end{aligned}$$

COMMON ANTILOGARITHMS

Enter from the margins with the given (common) logarithm, the corresponding number is given in the body of the table.

L	0	1	2	3	4	5	6	7	8	9	Proportional parts 1	2	3	4	5

L	0	1	2	3	4	5	6	7	8	9	1	2	3	4	5

$+$	Plus or Positive
$-$	Minus or Negative
$\pm$	Plus or minus Positive or negative
$\mp$	Minus or plus Negative or positive
$\times$ or $\cdot$	Multiplied by
$\div$ or $:$	Divided by
$=$ or $::$	Equals, as
$\neq$, $\doteq$	Does not equal
$\cong$	Equals approximately Congruent
$>$	Greater than
$<$	Less than
$\geqq$	Greater than or equal to
$\leqq$	Less than or equal to
$\backsim$	Similar to
$\therefore$	Therefore
$\sqrt{\ }$	Square root
$\sqrt[n]{\ }$	nth root
a^n	nth power of a
log or $\log_{10}$	Common logarithm Briggsian "
ln or $\log_e$ or log	Natural logarithm Hyperbolic " Napierian "
e or ϵ	Base (2.718) of natural system of logarithms
π	Pi (3.1416)
$\angle$	Angle
$\perp$	Perpendicular to
$\parallel$	Parallel to
a°	a degrees (angle)
a'	a minutes (angle) a prime
a''	a seconds (angle) a second a double-prime
a'''	a third a triple-prime
a_n	a sub n
sin	Sine
cos	Cosine
tan	Tangent
cot or ctn	Cotangent
sec	Secant
csc	Cosecant
vers	Versed sine
covers	Coversed sine
exsec	Exsecant
$\sin^{-1}a$ or arc sin a	Anti-sine a Angle whose sine is a Inverse sine a
sinh	Hyperbolic sine
cosh	Hyperbolic cosine
tanh	Hyperbolic tangent
$\sinh^{-1}a$ or arc sinh a	Anti-hyperbolic sine a Number whose hyperbolic sine is a
$P\ (x,y)$	Rect. coörd. of point P
$P(r,\ \theta)$	Polar coörd. of point P
$f(x)$, $F(x)$ or $\Phi\ (x)$	Function of x
Δy	Increment of y
$\doteq$ or $\rightarrow$	Approaches as a limit
Σ	Summation of
∞	Infinity
dy	Differential of y
$\frac{dy}{dx}$ or $f'(x)$	Derivative of $y = f(x)$ with respect to x
$\frac{d^2y}{dx^2}$ or $f''\ (x)$	Second deriv. of $y = f(x)$ with respect to x
$\frac{d^ny}{dx^n}$ or $f^{(n)}\ (x)$	nth deriv. of $y = f(x)$ with respect to x
$\frac{\partial z}{\partial x}$	Partial derivative of z with respect to x
$\frac{\partial^2 z}{\partial x\ \partial y}$	Second partial deriv. of z with respect to y and x
$\int$	Integral of
$\int_a^b$	Integral between the limits a and b
j or i	Imaginary quantity $(\sqrt{-1})$, $i^2 = -1$
$x = a + jb$	Symbolic vector notation
$n! = 1 \cdot 2 \cdot 3 \cdot \cdot \cdot n$
